For fine Teas—to run to an average on the London Ma... of a shilling and over, great care in plucking is nee... Where the third leaf is large, or the stalk long, one leaf ... bud only must be taken. The time between one flush ... another must never exceed seven days. The leaf must be sen... to the withering sheds *every hour*, where they must be ... mediately spread, in, if possible, a temperature not exceed... 70°. The bush must be allowed to make very full grow... Single leaves must be thrown away. The women should ... compelled to use baskets and not allowed to gather the lea... into their cloths, as the smell of these, and the heat of the bo... will damage the delicate aroma. The leaf must be snapp... off (plucked) and not pinched by the nail. Care must ... taken that no crushing in the hands takes place ; for, o... there is injury, oxidation starts, and spoils the make. ... much as regards the plucking for fine teas, the manufactu... will be dealt with under its proper heading. It may, howev... be here again remarked that it is impossible to make ve... fine teas of small, low, *hair-brush* China bushes. The grow... must be full, free and luxuriant, the produce taken bei... one-half of what is possible with ordinary treatment. ... the Nilgiris, about 200 pounds per acre is all that can ... depended on if quality be aimed at off pieces that would yie... double if quantity is worked for. It yet remains to ... proven that quantity and quality can be obtained. All t... efforts so far made within our knowledge having led ... similar results.

Level Surfaces—are obtained by continually breaking bac... leading shoots, and at times cutting out water shoots (*e.g.* ... gormandizers, the latter being done by the maistry in charg... of the party who should always carry a knife.

A new Style—of plucking has recently been adopted o... some estates with, it is stated, very good results, the produc... being very much increased. This is plucking only a leaf an... a bud for the first three months after pruning, leaving three ... four full leaves upon each stalk that is plucked. For the nex... three months, two leaves and a bud are taken, leaving mostl... two full leaves on plucked stalks ; and for the third thre... months plucking down to what is called the *fish leaf* (*i.e.*), th... pilule found on each stalk. The first three months are los... after a low prune usually. At the end of the season a ligh... prune follows.

Heating of Leaf—in baskets on the field must be most care... fully guarded against. The leaf should be frequently turned ... over and the baskets left under the shade of some tree. ... the leaf heats in the baskets, it changes its color as in oxidiz... ing, and never makes good tea. It in fact gets finally over... oxidized. It must be borne in mind that injury of the lea... immediately starts fermentation, unless the leaf be quickly ... spread in a cool place. It seems desirable to have the lea... brought into the withering sheds as soon as plucked and ... spread at once on the racks to attain best results, but this ... plan is expensive and very troublesome.

Mode of Plucking—helps quality, but we doubt very much its adding to the produce per acre. Given good soil and ordinary care in plucking, and a large yield, whether the one or the other system be adopted, will be the result. The one essential point is not to deplete the bush of its leaves after a heavy prune. Attention to this point being given, you may pluck anyhow, (*i.e.* with patent shears if you like), and you will secure your quantity, and your bushes will look healthy and full at the end of the season. On poor soil, however, with all care, the bushes will get full of red spider and look miserable with all care in plucking.

During Droughts—great care must be exercised to pluck only a few leading shoots and to allow the bush to make growth. Any attempts to force the bush to flush, by hard plucking, will ruin its power of flushing when rain does come. The object should be simply to preserve an even plucking surface.

Root Suckers—make wretched tea. The roll never colors, however much it is coaxed. These are better left to grow-up to the level of the bush before being plucked. The strongest shoots thus have a chance, too, of destroying the weaker mass, and thickening out to form good wood for future seasons.

The famous Maziawattee—yield of 1,200 to 1,400 pounds of made tea per acre has certainly not been the result of any particular system of plucking, and, if good results have followed the new system now advocated, the yield would have gone up considerably. Different sytems of pruning in coffee do not produce wood : that result has to be attained by the application of certain kinds of manure and needs favourable weather as well. A few years back some estates plucked

Two to three coarse Leaves—below the two leaves and a bud ; but it was found that the yield in place of being increased was lessened thereby. See Dr. Watts' Work on Tea, paras. 254 to 258. This was the system followed here in 1881 to 1883, and we were the first to stop it, and to follow the more rational system of two leaves and a bud. The following extract from a letter, dated October 1893, will show how firmly planters adhered to their old ways :—"You have again and again said it does not pay to make Congou. I don't agree ; but I wish you to give it a fair trial for the next two weeks. I want you to pick coarse three leaves even as well as bud and after half an hour's rolling pass through roll sifter to take out the fine tea and thus manufacture a lot of Congou" In 1881 to 1883 the maistry always asked for orders as to "How many Congou leaves to take, 2, 3 or 4." With the stopping of this system, the yield immediately doubled and the quality improved, so that progress was by leaps and bounds ! We have here fields varying in yield from 200 to 500 pounds per acre, on all of which the same system of plucking is followed, *viz.*, two leaves and a bud, while, on adjacent estates, where great care in plucking is exercised, off fields that ought, in our opinion, to yield 500 pounds per acre, no more than 200 has been obtained for the last ten years. We have this year a field of 8 acres (on a flat, formerly heavily manured for coffee, and upon which there has hardly ever been wash), which promises to yield over 600 pounds per acre this season. This with the same system of plucking. The field is young and had its first low prune in August 1898 only. A small field of hybrids, manured with cattle dung, has given 750 pounds per acre. The careful watching and keeping of records confirms us in the opinion that not much is to be gained by elaborate, expensive and worrying styles of plucking. Some system, readily understood and followed by the women, is needed and nothing so far has beaten the two leaves and bud style. Even with this rough-and-ready system, the

Bushes choke up—with too many buds upon healthy pieces, and a good deal of leaf has to be broken back and thrown away to allow light and air (acting upon a limited number) to bring up healthy, full flush.

NOTES.

Rogivue & Co., Ld. Mr. Alfred Ames has now joined this Company and become Director for Switzerland.

Calcutta Tea Sales. The average of the last tea sales was 6 annas 2 pies. There will be no further sales until the 24th instant, owing to the holidays.

Depreciated ! Latest cable quotation from London for Mysore average (B) size Coffee is 45s. per cwt. Apparently India is drawing ever closer to Brazil.

Liptonia. Asked to favour an American audience with a song, Sir Thomas strives to remember the words of an old song, and murmurs, "Oh, give to me, oh, give to me, the Cup. . ." Here memory fails him.

Bandong Quinine-factory. There has been a rather serious fire at the Bandong Quinine-factory (Java), and it is not expected that the company will be able to produce the quantity of alkaloid that they had promised to have ready for public sale next January.

Packets for Paris. It is well suggested by a Ceylon planter that packets for the Paris Exhibition should not be all as large as 1-lb. but that ½-lb. and even ¼-lb. packets should be included. As he says, a quarter of a pound of tea is a great deal, in popular French estimation.

Tea for Natives. A good deal certainly has been done of late in popularizing the use of tea among the masses ; but, says a Calcutta contemporary, much remains unaccomplished, and, until Europeans interest themselves personally in the subject, natives are not likely to extend their patronage more than they do at present.

Coffee in North Borneo. In his report for August, Mr. H. Walker, Commissioner of Lands, North Borneo, says of the old Chinese settlement "the Happy Valley" and Agong Agong :—The area of coffee planted is greater than I was aware of, and, although coffee is very low in price, I understand the people are prospering.

The Cameron (Africa) Discovery. Up to 26th August the amount subscribed towards the Cameron Discovery with regard to the prevention of leaf disease was £74-12. The discovery has been published, but recipients of the pamphlet have been requested to keep its contents private until the full reports of Messrs. Mahon, Miller & Co. have been published in the local papers.

The Agricultural Ledger. No. 8 of 1899 treats of the measurement of cattle in Europe, and comprises a summarised translation from the French of M. Paul Cagny's treatise on the Improvement of Cattle in the centre of Europe, and more particularly in the Grand Duchy of Baden, by a system of measurement.

Tea for the Troops. Thus the *I. P. G.* :—A good opportunity presents itself for advertising our teas among the troops about to take the field in South Africa, and as our Generals are fully alive to the efficacy of cold tea and its superiority over beer or spirits to men called upon to undergo more than ordinary exertion, agents should not neglect to push Indian tea into notice.

The Sale of Tea. Mr. A. J. Giles observes in his weekly "Notes on Trade Topics" in the *Grocer* :—There seems to be as keen a competition to do good to grocers by selling them tea with presents as there is among the European nations for the possession of Africa. Whether there will be a ruinous war, as the result in both cases, we shall see ; but we hope not.

The London Tea Market. In their weekly cable of 12th instant to Colombo, Messrs. Gow, Wilson and Stanton reported that the market generally was weak, medium liquoring and broken pekoes showing a slight decline. Fair liquoring Ceylon pekoe souchong was quoted 6¾d., average for the week 8d. Of 29,000 packages Ceylon tea offered 28,000 were sold, and of 47,000 packages Indian 42,000 changed hands. The average price of Indian Tea was 8⅝d.

Colombo Tea Sales. At the public sales of tea at Colombo on 11th instant, about 9,881 packages = 777,316 lbs. were offered, of which about 7,721 packages = 594,612 lbs. were sold. Market was again very firm for all grades except very commonest which were not quite in such strong demand. The *Times of Ceylon* remarks that good invoices were offered from Mocha, Agra Ouvah, Iona, Maskeliya, High Forest, Nonpareil, and Abbotsleigh.

London Tea Quotations. Messrs. Gow, Wilson and Stanton explain to the *Times of Ceylon* that their weekly quotations by cable do not relate to the best grade of pekoe souchong, but to a medium grade, which they describe as "ordinary leaf, fair liquor," and that prices for this grade vary considerably, some being much above 6¼d. while others are considerably lower. They add :—"We think that the grade which we wire out is perhaps a better criterion than would be the average price of all the pekoe souchongs sold."

Coffee in South Sylhet. A South Sylhet correspondent remarks that the weather which suits the tea is equally as favourable to the coffee bush, and says that, as far as he has seen, the coffee in South Sylhet has responded to the favourable season as willingly as our great staple has done. It is ripening off its berries gradually, and, by the end of this month, he thinks, all will have ripened and plucked. No disease has as yet shown itself ; but, of course, that can hardly be expected till the first heavy crop has been gathered.

The Indian Tea Crop. The following telegram, with reference to the tea-crop in the various districts, has been despatched by the General Committee of the Indian Tea Association, Calcutta, to the Committee of the Association in London, *viz.* :—*Assam.*—Immediate prospects fair ; but too much rain in some portions. *Cachar.*—Prospects throughout the district favourable generally. *Sylhet.*—Outturn last month about normal. *Dooars and Terai.*—Immediate prospects fair ; but too much rain in some portions. *Darjiling.*—Estimates of crop not likely to be realised.

Shade for Tea. According to "*Finem respice*" a letter to the *Ceylon Observer* :—The advisability of planting shade amongst tea has become clear to many Ceylon planters, (*a*) to modify "wash," (*b*) open up and improve the soil, (*c*) to break the force of wind, (*d*) to counteract the effect of long droughts, (*e*) to mitigate the attacks of insect and fungoid pests to which unbroken expanses of any single product are always especially liable, and (*f*) to supply timber and fuel ; and (2) the growth of the Para rubber tree is not so dense as to necessitate the lopping of its branches for the sake of tea growing beneath.

Queensland Coffee. The prize for the best all-round exhibit of coffee at a recent show at Cairns, presented by Mr. R. A. Kingsford, has been divided between Mr. A. Street, of Kuranda, and Mr. D. R. Lewis, of Cairns, as the exhibits of both of these persons were held to have been of equal merit. The prize was a sum of £2. 2s. By the way, Cairns is said to head the list by a long way as a coffee-producer, yielding 40,670lbs. out of the total yield for the whole colony of 56,552lbs. In the average yield per acre it stands third on the list, Rockhampton and St. Lawrence occupying first and second places.

Darjiling Tea. The *Planter* does not appear to think that the recent cyclone at Darjiling will have caused any material reduction in the local crops of tea. Our contemporary's conclusion is to the effect that Darjiling gardens, as a rule, stop plucking early, and the bulk of the crop had been made before the storm. Estimating that perhaps 15 to 20 per cent. of the total outturn for the year was still to come, the couple of hundred acres of tea lost or "damaged" will not affect the amount still to be sent down to Calcutta to any really appreciable extent, and there will probably not be the boom in Darjiling prices, that some seemed to anticipate.

The Regulation of Tea Sales. The market for Indian and Ceylon teas is not turning out as a good many seemed to think it would a short time ago, observes the *Canadian Grocer*. It was expected that, when the dispute over the one-pound draft question was settled, teas would be offered at the London auctions in such quantities as to induce lower prices. The cause they were counting upon to produce these bearish results did not put in an appearance, for, as noted in our last issue, a committee of five brokers was appointed to regulate the quantity of tea to be put-up at the regular auctions. This had the desired effect. And now prices, instead of declining, are advancing.

Vanilla in India. *Indian Gardening* says :—A correspondent in Southern India writes to us : "It is the greatest pity Vanilla is so little planted

here in India. It ought to do well planted where coffee is grown and would be a boon to planters when the latter fails. I have been very successful in growing Vanilla in Mauritius." Mr. James Laurie, of the Lungacherra Coffee Estate, South Sylhet, has been experimenting with Vanilla, and has achieved some success. The Vanilla pods on the vines in the gardens of the Agri-Horticultural Society of India, to which reference was made in these columns a short time back, are getting on very nicely; but are not yet quite ripe. When they are, we trust expert opinion will be taken as to their commercial value.

The "Standard" of Planters.

Thus states a Colombo writer:—The standard of Ceylon and Indian planters may have been very considerably lowered by the deplorable expansion of the "creeper-farming" system by which young men with more money than brains, after payment of a handsome premium and being allowed to defray their host's household expenses (and something over) for one or two years in return for the honour of looking after work (to the ruin of the labour-force), have become, in name, at any rate, members of the planting community. But we have still a fair sprinkling of planters left who do not devote half their time to cricket, tennis and football, and who do not prune their cocoanuts and arecas when appointed to the charge of low country estates."

Bulking and Blending Tea on the Gardens.

The *I. P. G* writes forcibly about what it terms "this necessary consummation upon which the future well-being of Indian Tea depends." Our contemporary appreciates the difficulties in the way remarking, for instance, that the universal adoption of bulking will entail the expense of special buildings, for few of our tea-houses have the accommodation to afford space for the operation on the scale we suggest Great stress is laid, however, on the fact that "it is essential that uniformity in quality should be secured, if we are to obtain anything approaching a steady price for our teas—present fluctuations render it almost impossible to forecast prospects:—completely upsetting every calculation and making what should be a steady business one of the most precarious."

Wants.

"We want uniformity in quality, a blend to suit public taste, consignments forwarded commensurate with the stocks at home and, if people can be induced to exercise prudence, a reduction in outturn. There are, of course, numerous other particulars deserving attention, but such only to be discussed at a conference; matters, for instance, as the reduction of the bonus. Quite enough has been written upon the warehouse rates and rigging of markets, we want now prompt, decided combined action, and the sooner all bestir themselves the better for another season, opening as 1899 did would mean bankruptcy for many concerns; the pulls upon tea must be reduced or the whole business will be sponged up by some half dozen large companies to the extinction of the small fry." That is what the *Indian Planters' Gazette* says.

State-aid for Coffee Growers.

A Sub-Committee of the Cairns Coffee Growers' Association, Queensland, recently reported in favour of the establishment of a central drying kiln for coffee. The advantages claimed were (1) ability to dry coffee in all weathers, (2) uniformity in drying, (3) the coffee would dry faster, (4) an earlier market for the coffee, and (5) growers would be able to put all their hands on to picking when it was most necessary. The Association subsequently passed a resolution "That this Association communicate with the Minister for Agriculture, asking him on what terms the Department would advance money for the purpose of forming central drying works." We gather from the report of the proceedings that the Government is prepared to make the necessary advance. It will be interesting to watch the result.

Cocoa in the United States.

It is pretty clear that Cocoa is well in the running with Tea and Coffee for the future business of the United States. The imports of cocoa for the fiscal year ending June 30, 1899, were the largest on record, comparing with the five previous years as follows:—

	Quantity. Pounds.	Value. Dollars.
1899	35,512,364	5,064,703
1898	25,717,404	3,492,033
1897	31,406,612	2,997,866
1896	23,276,597	2,387,078
1895	29,307,048	3,195,811
1894	17,634,779	2,402,382

There was a gain in the quantity of prepared cocoa imported—from 636,564 pounds in 1898 to 926,219 pounds in 1899; but this quantity was only two-thirds as large as the imports were prior to the tariff of 1897. The imports of chocolate in 1899 were also heavier, being 1,124,446 pounds, against 868,905 pounds in 1898, but still nearly 350,000 pounds lighter than before the last and higher duty of 1897 was imposed.

Wynaad Hybrid Coffee.

Forester (who is apparently an Irishman) writes to the *Planter*:—"The new coffee hybrid seems to be a distinct advance upon anything we have; but I have strong doubts as to its being a hybrid at all, although, even if it were not so, it need not detract from its value in the least." However, he also says:—"The main point to be gained in a cross is a more robust and disease-resisting plant, giving better quality and greater quantity than the parent forms. This would appear to all accounts to have been accomplished in South India, and they are to be congratulated on their success. But it will be a mistake if they stopped here, because we have every reason to fear that the disease-resisting qualities of a hybrid are only temporary, and, after a few generations under cultivation, it very likely may lose its resisting power. But as a start has been made at hybridising, there is little fear of its being allowed to die out again, as it is a wonderfully fascinating employment. And by the time the new hybrid shows signs of going to the wall, there will be most likely something far superior ready to take its place"

The Perpetuity of Feebleness by Hybridisation.

Mr. Wm. Paul, of Pauls Nurseries, Waltham Cross, writes to the *Gardeners' Chronicle*:—One result of the recent congress on hybridisation will, I have no doubt, be a large addition to the number of those engaging in attempts to vary and improve the different forms of vegetable life. May I be permitted to suggest, with due deference, that, in all efforts of this kind, the parents chosen, on both sides, should possess, if not a strong, at the least a sound and wiry constitution. How many feeble varieties of florists' flowers, admittedly of great beauty, have been ushered

into the floral world—varieties which it requires the utmost watchfulness and skill to develop fully, and which no amount of watchfulness and skill could keep in health or life over a lengthened period? This production is, we believe, generally, though not always, due to the setting-up of a standard of ideal beauty, in form, colour, &c., and working for its attainment, overlooking the vital point of constitution. How disappointing and disheartening to the ordinary cultivator to have to deal with such puny things! Nature, we admit, free of man's interference, often gives us such, and disposes of them in her own way; but do not let us, by our interference, add to the number whose cultivation gives us more pain than pleasure, but rather strive to lesson it by judicious selection in parentage.

Agricultural Banks in Mysore.

We read in the address of the Dewan of Mysore to the Representative Assembly:—The progress of these institutions was retarded during the year by the plague and its attendant general depression in trade and business. Moreover, the popular belief that Vikari is to be a year of great calamities made the people unwilling to unite for their mutual benefit, and several applications for Government aid to new institutions were withdrawn and others had to be kept in abeyance. The total number of banks receiving Government aid at the close of 1898-99 was 63 against 62 in 1897-98, two new banks having been opened and one old bank (Haniym) having ceased to work during the year. Of the 63 banks, 2 barely did any business during the year. The dealings of the banks amounted to Rs.4,02,288 under Receipts and Rs.4,09,829 under Disbursements. The net amount due to the banks by their members, inclusive of previous years' dealings, but exclusive of interest, was Rs.1,368,617, while the net amount due by them to Government and to depositors was Rs.13,55,471. The Reserve Fund at the end of the year amounted to Rs.21,489 against Rs.14,529 at the close of 1897-98. Twenty-eight out of the 63 banks received deposits during the year, against 20 in 1897-98, and the net amount of deposits held by the banks was Rs.11,240 at the close of the past year as against Rs.5,820 at the close of 1897-98. The members of these Agricultural Banks, who have pledged their united credit, own immoveable property of the aggregate value of Rs.50,41,637.

Planters and the Clergy.

In a recent address the Bishop of Colombo made special reference to the responsibilities of Tea Companies and of individual planters. *Inter alia* he said:—To say nothing of the number, now very considerable, of Christian conductors, tea-makers, and clerks, who are obviously poor men, the European Superintendents, and "sinna durais" are by no means well off. They are not always—it is not surprising—prepared to make much sacrifice in order to contribute to the stipend fund. Perhaps they ought to be; but, if a young man is not as anxious as he ought to be about these things, there is the more reason—not less—why his elders and those who profit by his labours should make provision for him. As things are, the burden of the maintenance of the clergy in our tea districts falls very heavily on a few: generally a few of the senior and married men, whereas, if the proprietors at home and specially the companies would recognize the duty—or, let us say, the wisdom—of contributing a proportion, which would be almost imperceptible per acre, the difficulty would be overcome at once. . . . When I apply, I supposed to be begging—as it is called—either for m or for my colleagues, or my profession; the clergym it is supposed—wants aid; and it is not the busine it is replied—of a public company to support parti clergy. But if it can be made clear that the lea planters and agents regard it, from the point of vie the planter, as a reasonable claim,—if such men show they think that provision should be made by proprietor the spiritual needs of those who live and work upon t estates, as well as for their comfort, their health, their r in illness, their leave, then I cannot but think that the a cation would be successful. I would not ask for subscript to a society: it must be clear that the application comes f a different side, and is not made in the interests of the Soc or of the Clergy, but in that of the Superintendents and t staff. Nor would I suggest that the acreage contribu should be made to any one church in particular, but tha should be credited in the accounts of each estate to religi purposes, and that the agents should assign it to a partic stipend fund, or expend it in a particular way, in view the circumstances of each district and the wishes of e Superintendent. . . Not that I can admit that a Super tendent, whether his proprietors help or not, can justifia decline his own responsibility. He is bound, as a part Christian duty, to set forward, as far as in him lies, worship of Almighty God.

LETTERS TO THE EDITOR.

AN INQUIRY.

Sir,—Will Mr. Thomas Brown, of Glendale, whose inte esting notes on building I have read with much pleasu be kind enough to inform me whether pillars, a brick-and- half in thickness, built of chunam and well-fired bricks (9 4½" x 3"), will be strong enough, spaced 10' apart, to suppo a king-post roof, of 20' space, with a covering of reepers a country tiles? Also whether the outward pressure could sufficiently obviated by bolting the tie-beams to the pri cipals, and the minimum dimensions of the former consiste with safety? Hurst in his table gives 9½" x 4" per a span of 2

Novice.

GENERAL ARTICLES.

NITROGENOUS PLANTS: ACTION OF THE TUBERCLES.

There is an extremely interesting article in the *Rural New York* by Mr. B. D. Halsted, of the New Jersey Experimental Statio showing the action of root tubercles upon leguminous plants th extract nitrogen from the atmopshere. The article is accompani by two illustrations which explain how these tubercles are form but which, we regret, we are unable to reproduce. Mr. Halsted, the course of his article, says:—The whole subject of root tub cles is a comparatively new one, and there is much to be found about it. It, however, seems settled that a close relationship exi between the taking up of the free nitrogen by plants and t presence of galls upon their roots. The majority of plants do n have such root tubercles, as, for example, the cereals, potatoes a the like, while clovers and clover-like plants are generally bearing, when the circumstances are favourable for their [illegible] When a soil is rich in combined nitrogen, the tubercles are mu less liable to from than when the soil is poor in such substanc

The host plant needs to be "hungry" for nitrogen for the full development of the tubercles These galls are produced by micro-organisms closely related to the bacteria; they make their entrance from the soil through the tender cell walls of the younger portions of the roots, and induce a cell growth in the region of the invasion that results in a tubercle. In some unknown way, the tubercle germs are able to lay hold and adapt the free nitrogen for the use of the plant that is bearing the galls.

There is a marked difference between the galls upon the roots of leguminous plants; for example, those of the pea are quite unlike those of the bean. . . . . Those of the beans are nearly spherical and usually most abundant near the base of the stem, and but few are met upon the ultimate ramifications of the roots. The pea galls are irregular and somewhat fan-shaped in outline, and generally distributed along the main or tap root. From the great difference in size, shape and distribution, one might easily think that they were caused by distinct kinds of germ; but there is no marked distinction in the micro-organisms when studied with the microscope. It is true that a germ that has grown upon a certain crop plant is more at home upon that kind of host. In other words, soil extract from an old pea field will produce galls upon pea roots in new land better than upon clover or any other crop.

This leads to a word upon the subject of soil inoculation. The study of the tubercle germs has gone so far that now they are isolated and sold in the market under the trade name of "Nitragin." This is a "starter" in land when the germs are not present; very good results have come from the use of this germ fertiliser. A small bottle of it is enough to make a difference of tons of yield in certain crops, as shown by experiment at the Alabama Station with Crimson clover and Hairy vetch. Of course, soil that contains the germs may be used in the same way, and in some instances, a ton or less of old soil where clover or clover-like crop has been grown, may be spread upon land new to the same crop there to be grown with excellent results. During the past year, in one experiment at this station, I found that soil from old pea land made a striking difference upon new soil, in the larger growth and deeper green color of the pea plants. The yield of pods was also increased. There is a large field for study in these tubercles, and the service they render the foster plant in the securing of a supply of nitrogen. In the June, 1898, number of the *Industrialist* issued at the Kansas Agricultural College, D. H. Otis gives an account of some inoculation experiments. Soil in which Soy beans had grown in Massachusetts was brought to Kansas, and used to grow Soy beans there when mixed with Kansas soil. The tubercles were formed in this mixture, and this Kansas soil was afterward used to inoculate other soils. Mr. Otis says that this inoculation is entirely practicable.

THE DANGER OF OVER-FEEDING IN CULTIVATION.

Mr. Wm. Paul, Paul's Nurseries, Waltham Cross, writes in *the Gardeners' Chronicle*:—

After a pretty wide reading of garden literature during the last fifty or sixty years, I remain impressed with the idea that many of our writers on gardening are not sufficiently guarded in their recommendations of the use of manures. The practical man who knows his business and thinks before he acts is not likely to be led astray, but in these days when so many who have little knowledge of gardening are anxious to make it a hobby, they and their assistants are open to be unfavourably influenced by the too general or too emphatic recommendations of this or that manure. I met with an instance, not very long ago, of a man watering some Rose-bushes with liquid manure from a sewage-pond, which instead of increasing the size of the flowers, as was intended, caused both flowers and leaves to turn yellow and drop off. I have often seen spots of ground on which heaps of manure had lain during winter refuse to grow anything until ridged up and well exposed to the air for a season; if plants and trees were put on them without this intervention, they dwindled and died, poisoned by over-feeding. These, I admit, are extreme cases; but there is a gradual and almost imperceptible poisoning by over-feeding often going on from day to day, year to year, culminating in serious results at last, made manifest by an overdose, or by some peculiarity of the season. It would, perhaps, not be difficult to prove that many of our strains of florists' flowers have been brought into a delicate and tender state through over-feeding, with the view of getting large flowers. Cultivators of these should be wary in this practice; feed liberally [at sufficient intervals], but do not gorge your plants.

It is the same in the vegetable as in the animal kingdom, nutrition does not depend on what is taken into the system, but upon what is digested. I remember the Potato on a neighbouring farm prior to the appearance of the Potato-disease being an easily cultivated esculent free from disease and serious insect attacks, until it was deluged with fresh manure, and its functions of flowering and seeding also arrested with the view of adding to the number and size of the tubers. Then came disease with all its sad consequences This I attributed principally to over-feeding, and I did not come to this conclusion without ascertaining the antecedents of cultivation of the particular crop under observation, and studying the individuals with the aid of one of Ross's best single microscopes.

If a second case in point were needed, one might quote the Hollyhock. Originally, one of the hardiest of biennials; it almost died out a few years ago, after previous years of high cultivation with the view of getting giant spikes and flowers. But numberless are the instances of debility met with during a long life, and which rise to my mind while I write, which it seems most reasonable to attribute to what is called high cultivation, brought about principally by over-feeding.

TEA, ETC., COMPANIES.

The Consolidated Estates Co. (Ceylon):—Pays on the Preference shares a balance dividend of 4 per cent. making 8 per cent.. for the year. On the ordinary shares it pays 5 per cent.; and, besides redeeming Debentures to the extent of £2,266, carries forward £671.

The Duckwari (Ceylon) Tea Plantation Co., Ld.—The balance of profit and loss account, after writing off 10 per cent. depreciation on value of machinery and buildings, is £2,914 8s 4d., which the Directors propose should be applied as follows:—(1) In payment of 7 per cent. dividend on Preference shares, £840; (2) In payment of 7 per cent. dividend on Ordinary shares, £560; leaving £1,514 8s. 4d. to be carried forward next year. The returns of crop have been 277,408 lbs. tea and 10,012 lbs. cardamoms, against 229,670 lbs. tea and 12,655 lbs. cardamoms last season. The large increase in tea is to be attributed to the free use of artificial and bulk manures.

The Alliance Tea Co., of Ceylon Ld.—has declared an Interim Dividend of 3 per cent. on the working to 30th June last.

Scottish Ceylon Tea Co., Ld.—has declared Interim Dividends at the rate of 10 per cent. per annum on the Ordinary, and 7 per cent. per annum on the Preference shares for the half-year ending 30th June last.

Poonagalla Valley Ceylon Co., Ld.—has declared an Interim Dividend at the rate of 5 per cent. per annum (free of Income Tax) for the half-year ending 30th June last.

Burnside Tea Co., of Ceylon, Ld.—has declared an Interim Dividend at the rate of 5 per cent. per annum (free of Income Tax) for the half-year ending 30th June last.

Highland Tea Co., of Ceylon, Ld.—has declared an Interim Dividend at the rate of 6 per cent. per annum (free of Income Tax) for the half-year ending 30th June last.

Bandarapola Ceylon Co., Ld.—has declared an Interim Dividend at the rate of 7 per cent. per annum (free of Income Tax) for the half-year ending 30th June last.

Ederapolla Tea Co., of Ceylon, Ld.—has declared an Interim Dividend at the rate of 6 per cent. per annum (free of Income Tax) for the half-year ending 30th June last.

Kelani Valley Tea Association Ld.—has declared an Interim Dividend at the rate of 6 per cent. per annum (free of Income Tax) for the half-year ending 30th June last.

The Diaygama (New Dimbula) Co., Ld.—has declared a Final dividend of 15 per cent. (making 20 per cent. for the year, against 16 per cent. for 1897-98).

The Nuwara Eliya Tea Estates Co., Ld.—has declared an ad-Interim Dividend of 3 per cent. (same as last year).

Portmore Tea Company of Ceylon.—The Directors of the Tea Company of Ceylon, Ltd., have declared an *interim* dividend of 5 per cent., being at the rate of 10 per cent. per annum, tax free, for half-year ended 30th June.

The Doomoo Tea Company of Ceylon.—The ordinary general meeting of the Company was held on 16th instant at Colombo. The chair was taken by Mr. F. W. Bois.

The Report stated that the quantity of tea received from the two estates was 196,585 lbs. out of an estimated crop of 220,000 lbs., against 205,902 lbs., last year, and the price realised was 42·83 cents per lb. against 43·13 cents last year.

After writing off R2,500 to depreciation account and R2,500 to reserve account, there remains available a sum of R24,787·52. A dividend of 6 per cent. for the year was declared

The Korale Estates Company (Ceylon)—The Korale Tea Estates Company, Ltd., has paid 5 per cent. on account of the Preference shares; and nothing on the Ordinary shares.

PLANTING IN CENTRAL AFRICA.

There are worse places for planters in some respects than British Central Africa, says *The Home & Colonial Mail*:—

Of course capital is wanted, but the labour market is the cheapest in the world, the rate being about three shillings a month—paid in calico. Land is cheap, and will grow anything, and give enormous crops. On the other hand, it cannot be said to be a healthy country. There is a heavy, continuous rainfall for six months, the climate is malarious, and as black-water fever is prevalent, the death-rate is high. Whites fare well; Indian cooks, veritable chefs, are employed. There is no variety in the food, the staple is "chicken," but the game is excellent. Order is kept by a standing army of 300 Sikhs, with white officers. The Duputy Commissioner commands the British Central Afraican Rifles, which consist of two battalions of natives, one of which is at the depôt in Mauritius. The best coffee in the world comes from Nyasaland; it fetches the highest prices, and so does the tobacco. The planters are mostly Scotch. A good deal of rubber is also finding its way through the Protectorate from the Chartered Company's territory north of the Protectorate.

ADVERSITIES IN THE LIFE OF PLANTS.

In the course of a lecture before the Pharmaceutical Society, Professor J. Reynolds Green stated that the phrases "struggle for existence," "survival of the fittest," and others of a like nature, are not easily understood by those who take a casual glance at the book of Nature.

As examples of plants growing under adverse climatic conditions, certain moorland types were described. Moorland is so plentiful in this country that it has been said that it is possible to walk from Ilkley in Yorkshire to Glasgow without stepping off the heather. In such bleak situations, devoid of shelter and of trees, only those plants grow that can withstand extremes of cold and heat, of dryness and damp. The water is so pure, so free from mineral salts, that the nutrition of plants suffers accordingly.

The Ling is particularly successful in coping with these difficulties by developing a marked individuality. It puts forth low, wiry, straggling stems, and possesses deep-seated roots. The special character about its leaves is that they are dry, hard, and evergreen, last for two or three years, and then crumble, but do not fall. Large intercellular spaces are formed; the stomata are deep-seated, and protected by hairs. By these means the Ling secures many advantages: the deep roots cover a lot of ground, while the hard, tough leaves serve to guard the plant from drought, being helped by the protected stomata, which prevent excessive transpiration. Furthermore, the leaves being evergreen, the power of feeding is held in reserve, so that the plant can take advantage of the short snatches of fine weather that occur even in the winter months. Moreover, the chlorophyll-containing cells being arranged all round the central respiratory cavity, or air-space, the plant is provided with every conceivable adaptation for availing itself even of transient gleams of sunshine all the year round. Erica, another moorland plant, possess rolled leaves, thus exposing a small leaf-surface, with hairs on the under surface and protected stomata. Plants so exposed to biting winds economise shelter and re leaf-surface and the above-ground part to a minimum.

Another kind of difficulty with which plants have to contend the

CROWDING OF LEAVES,

which makes it hard to obtain an equal illumination. Since a siderable amount of energy and much food material are used in producing leaves the plant requires to limit their numb whilst, on the other hand, it is advantageous for the plant to rece a maximum of illumination, which entails a corresponding mu plication of leaf-surface. To avoid overlapping a modification ta place in the length of the leaf stalks. For example, Gerani pyrenaicum, a plant growing on waysides and in meadows, ha small axis, and lies almost flat on the ground. The enorm number of its leaves renders the problem of packing no easy ta but it is performed by a co-ordination of the lea stalks, the old being the longest, forming loose rosettes Thus no shading resul while all the leaves are well-illuminated, and in one plane. Ca panula pusilla, growing on the steep slopes of sub-alpine regions, h a similar mechanism. The flower-stalk, rising vertically, be small narrow leaves, which point upwards at a sharp angle, and do not shade the rosettes below, while they obtain an equal illum nation for themselves. By a co-ordination of leaf-stalk and blad the stalk alone is in shadow, and that does not matter. This c ordination of the length of the stalks, the lower being six or eig times the length of the higher, is well seen in Amarantus. Datu and Impatiens. The stems of these plants are elongated, and wh viewed from above the whole plant looks like a rosette. In Datu the small leaves are developed between the larger ones, there effecting an economy of space.

Passing to trees, it was shown how a similar mode of behaviou obtains. The terminal erect branch of Acer platanoides, the No way Maple, shows decussating leaves, *i.e.*, pairs of leaves succe sively placed at right angles, that do not shade each other. Th lower stalks having the advantage in length, form a sort of pyramic while the stalks of each pair are equal in length. On the latera (horizontal) branch it is seen that the stalks of each pair are u equal in length, one being sometimes three times as long as th other; thus the branch exhibits an almost perfect adaptation to vertical source of light. Other mechanisms than co-ordination ma give a similar result, *e.g.*, by a twisting of the internodes, as ma be noticed in Helianthemum, Diervilla, the Hazels and Beeches and other plants. In Helianthemum, the Rock-Rose, the sten being low and flat, some of the leaves twist through ninety degrees so that two rows are produced instead of four. In certain case the petiole twists, in order to bring about a similar result. A further method of gaining a maximum amount of illumination i found, *e.g.*, in Broyonia and Ficus, mosaics being formed by th economical arrangement of unsymmetrical leaves, which appear t be packed into each other. An economy of space is thus effected by utilisation of the irregular shapes of leaves. Atropa Belladonna furnishes a good example of plants whose adjoining leaves are unequal in size The larger leaves are in two rows, and the gaps left between them are filled by small leaves, which twist themselves until they come to lie in the gaps, forming a mosaic pattern. Ulmus is an example of trees that show the same beha viour, in taking advantage of the unsymmetrical form of the leaves.

Besides difficulties arising from adverse climatic conditions, and those connected with the attainment of a maximum degree of illumination with a minimum expenditure of leaf-surface,

PLANTS OFTEN HAVE TROUBLE IN OBTAINING WATER.

The absorption of water is a serious problem in the case of epiphytes, *e.g.*, certain Orchids. The flattened, strap-shape roots which anchor the plant to the surface of a tree, do not derive enough water from the crannies in the bark to supply the needs of the plant. The air in tropical forests—the home of epiphytes—being humid, long roots hang down to absorb moisture by means of a glistening, spongy coating of cells known as a velamen. These plants in this way may obtain from 8 to 13 per cent. of their weight of water, and once obtained it is not readily parted with.

Terrestrial plants sometimes have peculiar ways of dealing with the problem of water supply. The normal course is for the root-hairs to come into intimate contact with the soil, and absorb from it a film of water. When this source is inadequate, abnormal means are adopted. Thus Stellaria media, the common Chickweed, has a ridge of fine, delicate hairs running from node to node. These hairs catch and absorb water when a shower falls by means of an

appropriate mechanism. The common Ash has a grooved rachis, strengthened at the sides, the groove being curved at the edges, forming a channel which gapes open when leaves are exposed on the rachis. Absorbing hairs and glands are found along the groove, and these act as a subservient mechanism for utilising showers by the collection and retention of rain. The leaves of the Aspen (Populus tremula) possess cups with an absorbing surface; the fibro-vascular bundles almost reach the absorbing surface, and so in a shower the plant is well supplied with water. A kind of varnish is then secreted, which swells, and so retains the water.

One of the most ingenious mechanisms for procuring water is possessed by certain species of Saxifraga. A depression in the thick and succulent leaf absorbs and holds water; there are prominences (plugs), and water glands in the hollow, besides openings (water-stomata). Water charged with lime is poured out, and forms a calcareous cake over the depression. In this way water is absorbed, and passed to the gland beneath; this method is common in plants growing in deserts. The Teasel has leaves with sheathing bases, which act as funnels; delicate protoplasmic filaments are said to absorb water from these cups into the plant-body; but this is open to doubt. Insects are sometimes accidentally caught in these cups, and their capture serves as an additional advantage to the plant.

PLANTING TROUBLES IN BRAZIL.

Financial trouble in Brazil is having a serious effect on the coffee industry. The rise in the value of the milreis and the uncertainty of the power of the Government to maintain it paralyses trading in every direction. To achieve the rise, taxation has been augmented wherever the authorities found an opportunity to re-classify goods, so that many importers refuse orders to travellers from pure uncertainty as to what duties might be exacted when the goods arrive. Already diminished Customs returns have to be faced, and as in Argentina the popular opinion favoured a high gold premium, that in the Brazils supported a low milreis value, the producer getting more for his produce sold on a gold basis. The coffee crop is the main dependence of the Brazils, rubber, sugar, and cotton following, but these have of late suffered from diminshed production, while coffee, on the other hand, from the heavier crops of the past three years, has suffered in value until at the present time it is claimed by competent traders that there is no margin whatever for living expenses, and in consequence it is reported that interior banks have an increasing number of mortgages on coffee plantations on their hands, one recently having to liquidate, handing over fully one thousand such mortgages to a Rio bank as security. The crop recently completed proved a million and three-quarter bags smaller than the preceding, and with the dislocation of prices causing poorer returns the outlook for the future of this industry is so involved that competent houses in Santos and Rio have refrained this year from issuing any estimates of the present crop, partly from the uncertainty of the extent of new bearing lands, but more from the expectation of an unknown quantity that may be abandoned compulsorily.—*Home & Colonial Mail.*

HEIGHT-GROWTH IN PLANTATIONS.

Mr. J. Simpson writes in the *Gardeners' Chronicle*:—

The term "height-growth" in forestry is derived from the German. Neither the words nor their meaning have ever had any significance in British forestry practice, and the importance of height-growth as a factor in the production of timber does not appear to have ever been so much as thought of On the continent, on the other hand, height-growth is the first thing the forester concerns himself about after he has planted his trees. Get height-growth, he says, and the rest will come. Height-growth has the same significance as "drawn up," an expression well known to gardeners, who seldom want height-growth in their productions, as that, as a rule, would be against the object they have in view, which is lateral development in trees and bushes and in fruiting plants, crops. The editor may perhaps remember me writing to him a year or two back on this subject, and asking for explanations of a puzzle that physiologists have not yet solved, viz., how trees in crowded woods, dells, and ravines, get pulled up at such an extraordinarily rapid rate compared to isolated trees in the open; and how more timber is produced to a given area in that way than when the trees are grown wide enough apart to develop to their utmost extent? Let me give an example or two. For over thirty years I have watched the gradual filling up of a precipitous narrow gulley with trees, and marked the comparative progress of the trees on the steep sides of the gulley.

At first, when the ravine was planted, a section of it would have appeared like the letter V with the plants (all then about the same size) on each side. But gradually, as the trees grew, the acuteness of the angle of the V grow less and less, owing to the trees lower down growing faster than the trees higher up, until now the tops of the trees are nearly level across the ravine. At the top edge of the cliff the trees are short, and in the bottom tall and cylindrical, and by far the more valuable. We have frequently wanted very long larch-poles for sinking purposes, for minerals, and all the poles have been got from this wood. This will show that the timber is tough and of good quality. The poles are laid over tressels with the long point projecting considerably beyond the last support, and the "spring" of the pole is worked to drive the sinking apparatus up and down, a man working the pole.

Some time ago your well-known correspondent, Mr. Burbidge, sent me a pen-and-ink sketch of a section of a ravine planted with Scotch Firs, near Newry in Ireland, that would have illustrated my meaning well, but a type-writing company lost it, to their cost and mine too. This sketch showed the Firs as tall as masts in the bottom of the gulley, and those at the top, in the exposed field on each side, rough-branching specimens, unfit for anything but firewood, and about half the height of the others. That is height-growth! The Douglas Fire pole at Kew is another fine example of height-growth. It is about 160 feet high, and only just a little less in girth at the top than at the bottom. How a timber merchant's mouth would water over that pole! He could enter his saw at one end and cut one continuous plank out of it 55 yards long, with very few knots. I have twice measured the Douglas Fir specimen at Dunkeld, planted about 1845, and now containing well on for 100 cubic feet, and compared it with the Kew pole, much to the disadvantage of the former, for whereas the first represents a perfect timber tree, the other, from the same point of view, is an abortion of the candle-extinguisher pattern, having every fault that a trunk of timber can have—viz., too much taper, and a multitude of coarse knots over its entire surface. The opinions of the saw-mill man and the forester—as distinguished from the tree-lover—are sadly at variance on such subjects. When the Royal Scottish Arboricultural Society visited a certain estate in Ireland, the proprietor took pride in showing the visitors two favourite trees of the umbrageous type, more limbs than trunk; and was shocked by hearing a timber-merchant, member of the Society, whisper to another, "Two brutes!"

If only the importance of height-growth in forest-trees was better understood, there would be more glens and ravines planted than mountain-tops, and our woods would be dense everywhere. The common Alder grows about 40 feet high in the open, and is a rough tree, but attains to 60 feet and 70 feet in a plantation of the taller-growing Oak and Ash, that pull it up. The Elm is said to double its height or more under the same conditions, and the Birch does the same. The common Hawthorn, as everybody knows, does not greatly exceed the dimensions of a bush in the open field, but I have seen it 40 feet high, with a perfectly straight stem, in an old Oak wood. I left it standing, but it blew over soon after its neighbours were felled. The height-growth of all plants as well as trees is influenced by the same conditions. About twelve years ago I planted a long plantation of Firs and other species on very rough ground, where Brambles, Nettles, rag-weeds, Thistles, &c., abounded, and it has been interesting to watch the struggle for existence among the weeds and trees The trees were planted 3 feet apart, and have not yet been thinned. The first few years the weeds and rank grass had to be beaten down to give the trees a start, otherwise they would have been smothered. After they got the lead, however, it was the turn of the weeds to fight for their existence. In many places these have quite succumbed, the ground being now bare under the trees; but the weeds named struggled on for years, and many that I measured lately were from 6 to 8 feet high—a

height far exceeding their usual growth in the open. They were, of course, very attenuated, and could not have held their heads up but for the shelter the trees afforded them. The Bramble, which previously seldom rose above 2 or 3 feet from the soil, I found last year overtopping some of the trees about 14 feet high, struggling to reach the light, just like the Potato mentioned by Dr. Lindley, which, lying in a dark cellar, pushed a shoot some 12 feet long, till it reached a hole in the wall, where the light came through. The common Bracken, however, beats all other plants for asserting itself in a crowd. I have seen it on the bleak hills of the Isle of Man, not exceeding 6 or 9 inches in height; but hereabouts it keeps pace with young plantations for years, if it can get the end of a frond out to the light. Fronds 7 and 8 feet long are common in the woods, and we once found one 12 feet long in a thicket of underwood. It was tied to a rail and taken care of as a curiosity.

A belief exists among some foresters that girth is sacrificed to height-growth when the latter is prolonged, and it is that notion that has led to such severe thinnings in this country. No doubt the drawing-up process may go on too long, but it is surprising to see how tall all species of trees are allowed to grow in German forests with exceedingly slender stems, and yet become good, thick trees before the end of the rotation period. We do not look close enough into the question of increment in our forestry practice, or we should not be so nervous and generalise so much. So long as a tree lives and has a healthy top, however small, a ring of new wood, however narrow, will be added to the trunk annually; and it is a very narrow annual ring indeed that does not produce a measurable quantity of timber over a tree of fair size. One-sixteenth of an inch to the girth is not much, apparently, but the layer goes round the tree, and over the whole surface of the trunk it means a large addition to the bulk. The telegraph-poles on the highway, and the scaffold-poles we see set up in the streets might read the forester a lesson. Mark their proportions: the 30 or 40 feet telegraph-pole, about 9 inches in diameter, is nearly as thick at the top as the bottom; some are so nearly cylindrical in shape, that the untrained eye can hardly tell the thick from the small end, yet these poles are only part of one tall tree, nearly the same girth throughout, not very old, that never had more than a small tuft of branches at the top to carry on elaboration and growth; and a close examination of a section of such a pole will show that the annual rings are of fair measurable width, and very regular.

The extent to which height-growth is influenced by situation is most frequently noticed by those who have to practise in an undulating country of hill and dale. The difference in the height of the trees and length of bole in different situations, not as regards height above the sea, but only so far as relates to the configuration of the ground, is very remarkable. Even a mere depression in the ground makes a difference, and a marked one.

Not long since I had to value and sell nearly 20 acres of Larch, growing at an altitude of about 1300 feet. The ground was very poor, and consisted of a series of hillocks or mounds, so artificial-looking in shape as to suggest that they had been raised by the hand of man. Both the heights and the hollows were planted at the same time—about seventy years ago; and when I valued them standing, the average dimensions of the trees were about 6 cubic feet, yet the trees ran from 1 foot up to 23 feet, according to the position An average of the two extremes would have given 12 feet as the general average, but what pulled the average down was the number of stunted short trees that grew on the high and exposed knolls, these seldom exceeding 1 ft. or 1½ ft., and a careful average had to be taken in every part of the wood. The winding narrow gullies everywhere held the best and tallest trees, some reaching a height of 50 feet where they were drawn up. The total quantity of measurable timber estimated in the lot was 36,000 feet, or a little under 2,000 feet to the acre all over, and it fell just a little over the estimate, the most of it going to one consumer for pit work—for about 1s. per foot delivered, the road being bad and long. Roughly speaking, the trees in the gullies would average about 9 cubic feet, and the poor ones on the high ground about 3 feet, a difference due not to soil, but to the comparative shelter afforded in the different positions, and the pulling-up process—the height-growth. The wood had never been thinned, and the tall trees varied greatly in girth. All were about the same height, but while some did not quarter-girth more than 3 inches in the middle, others would girth double that and more, showing that the height-growth was not due to shelter alone, but to their being drawn up in the struggle to reach the light.

OIL OF CARDAMOMS.

Mr. E. J. Parry, B.Sc., F.I.C., writes to the *Chem... Druggist* :—

The chemistry of oil of cardamoms is in a very hazy cond... owing to the fact that those who have reported on the su... rarely state what they mean by "cardamoms." The most r... figures for the oil are those given by Schimmel in the Repo... April, 1897, where it is stated that oil of cardamoms (Ceylon) ... sp. gr. 0·895 to 0·910, and an optical rotation of − 12° to + 13°... of Malabar cardamoms is described in the Report for October, ... as being much higher in price, and therefore unable to com... with the commercial oil. The seeds are described as being dif... to obtain, and the oil as having a sp. gr. 0·943 and an optica... tation of + 34°52′. Haensel in his 1896 report, in commenting ... a cardamom cultivated in the Cameroon country, contrasts ... physical properties of the oil from it with that of Malabar ca... moms, thus :—

	Malabar	Cameroon.
Sp. gr. at 15° C.	0·9338	0·9071
Opt. rot. in 100mm.	+26·0	−23·5
Refract. no. at 25° C.	54·1	62·5
Index ref. at 25°C.	1·4612	1·4675
Iodine no.	123·7	152·1

"One volume of Malabar cardamom oil," he adds, "is not q... soluble in 45 volumes of 60-per-cent. alcohol, and one volum... Cameroon cardamom oil is not quite clearly soluble in 250 volu... of 60-per-cent. alcohol."

These expressions of opinion serve to show that distillers take ... oil of Malabar cardamoms as their standard, but it is not uncha... able to suppose that the more abundant and, on the whole, chea... Mysore variety is used for distillation-purposes. Anyway, ... experience with the commercial oil did not fit in with either ... these records, and I wish to satisfy myself as to the relative diff... ences, if any, between oil distilled from Malabar cardamoms a... that from Mysores. I, of course, refer to these varieties as cu... vated in Ceylon, which almost exclusively come to Europe, the or... direct imports from India being a portion of Malabar and a f... amount of Mangalore cardamoms, which are used, I am informe... as a spice for special purposes.

Ceylon-Malabar cardamoms and Ceylon-Mysore cardamoms co... into the market as the whole fruit, but large quantities of the se... freed from the pericarps are also imported and sold. Whether t... latter are bought by distillers or not is a question which did n... come within the present inquiry, which had solely for its obje... determination of the properties of the two oils, and identity w... best ensured by purchasing the entire fruit. These were obtain... from London drug-brokers who were able to positively guarant... the same. The seeds were distilled for me by Messrs. Evan... Sons & Co., of Liverpool, whose courtesy I have to acknowledge.

The Ceylon-Malabar seeds yielded 1·3 per cent of oil, and th... Ceylon-Mysores 2·6 per cent. Both were bright yellow liquid... whose odours were scarcely distinguishable. The sp. grs. an... optical rotations were as follows :—

—	Sp. Gr. at 15·5°	Optical Rotation at 16° (100-mm. Tube)
Oil of Malabar cardamoms ...	0·9418	+40° 41′
Oil of Mysore cardamoms	0·9418	+46° 39′

These figures are in fair agreement with those given for Malaba... oil, but in no way resemble those quoted by Schimmel for Ceylo... oil, which I do not at all understand.

The oils were soluble with a slight opacity in 40 to 45 volumes o... 60-per-cent. alcohol, agreeeing with Haensel's oil, which, however ... has a much lower rotation.

I find little difference between the two oils. On distillation a... ordinary pressure the oil, which is very rich in esters, in both case... decomposes partially, and a considerable quantity of free acid distil... over. According to Weber (*Annalen*, 238, 89), formic and aceti... acids are found in the distillate. Acetic acid is undoubtedly th...

hief acid constituent of the esters, but I am unable to confirm the resence of formic acid. If it is present, it is only in faint traces. On distillation under reduced pressure the earlier fractions (the oiling-point rises gradually until 50 per cent. has distilled over) ontain cineol, but only to the extent of 5 to 10 per cent. of the oil. This figure is the result of an approximate estimation by means of hosphoric acid. The earlier fractions also contained one or more erpenes, amongst which I identified limonene. Weber states that erpinine is also present, but I was unable to identify this hydrocarbon, nor could Schimmel find it in Malabar oil; and as it easily forms a vell-defined nitrite when present, it cannot exist in an appreciable quantity. A small quantity of terpineol is present in both oils, and s easily identified by its phenyl urethane. Schimmel states that t is an optically active modification, but I had not enough oil to examine this. The terpineol comes over with the fraction obtainep t 160°-170° C. at 18mm. The nature of the alcoholic constituent f the greater part of the esters requires further elucidation.

From the economic point of view it will be seen that Ceylon-Mysore cardamoms are preferable to the Ceylon-Malabars for distillation purposes, as they give the larger yield.

THE COST OF MANURING TEA.

A proprietary planter sends the *Times of Ceylon* a practical statement on this question, as follows :—

I consider the statement that the cost of manuring has been reduced by half is substantially correct, at any rate as regards this district—which, however, you need not name. Manuring used to cost, say, R60 per acre, and most men are now spending R34 to R35. My expenditure is even less than 50 per cent. Mr. Pett recently asked whether the saving was in the cost of the manure, or in the application. As application, generally speaking, costs R7·50, the saving is in the material. Mr. Pett says there is little difference in cost whether you fork or apply otherwise. Now if you cut holes and bury prunings, etc., the cost will be close on R15 per acre (mine cost me R13·45), but if you fork manure in it can be done for R3 per acre Generally manure is applied in half circles round the tree, holes cut 6 inches deep, and the cost is the figure I have named above (R7·50). If the tea is planted 3 feet by 4 feet, an acre should have 3,630 plants, but roads, drains, &c., will take off a good deal, and 3,000 plants is about it, without vacancies. Thus if the manure recommended is 6 cwt, per acre or 3 oz. per tree, this quantity which on paper is equal to $3\frac{1}{3}$ acres, in reality is enough for 4 acres as nearly as possible. Take R34 against R60, and you save 44 per cent. practically speaking $\frac{1}{2}$. I have altered application to suit different parts of the estate, but the majority is forked in at 250 trees per coolie. Say R4 per acre. I send you my figures from my books as proof :—

(*August Consignment.*)

	R.	C.
Mixture in Colombo	330	00
Less 5 per cent.	16	50
	313	50
Mixing Manure	2	00
Transport to Station and rail	44	52
	360	02
Transport from Station to Estate	19	24
	379	26

4 tons cost R379·26; 1 ton cost R94·81; 1 ton equals 4 acres.

1 acre costs	23	70
1 acre application	4	00
Total cost per acre	27	70

The next lot of manure cost somewhat more, but the percentage contained is more, therefore it will take less manure to do an acre, and works out at very little more. I increased the basic slag for gray blight :—

Application	4	00
Total cost per acre	29	52

One lot cost R27·70; one lot cost R29·52—Average cost R28·61.

LONDON CHARGES OF TEA COMPANIES.

Under this head, the *Investors' Review* is publishing a series of articles. We give the first of these, taken from the issue of September 16 :—

There is little doubt that the tea-grower is feeling the pinch of hard times rather severely. Under ordinary circumstances such a development as the rise in the Indian exchange from 1s. $0\frac{1}{2}$d to 1s. 4d. per rupee, with its concurrent advance in the cost of production in India and Ceylon, would have been accompanied by some improvement in the European price for tea that would have served as a mild offset to the increased expenditure of the planter. The mania, however, for extensions some years back has quite put this natural remedy out of the question, for the knowledge of the enormous area of tea-plants coming to maturity, combined with the larger quantity of tea sent to market, has the effect of preventing any recovery. Consequently the average price of $8\frac{3}{4}$d. per lb. for last season was no higher than the average price obtained when the rupee was at its lowest, although last season was favoured by a little "boom" in the spring as a result of the accidental circumstance that for two seasons in succession the Indian crop as a whole had been poor in quantity. Anyone acquainted with the real position of the industry feels that if only the average yield per acre returns to its normal figure, a further decline in the price of tea must be faced.

This may be taken as an axiom, admitted but not talked about, by tea-growers, and profits having been seriously eaten into already by the course of events, there has been a great searching to find economies that would in some respects guard producers against a further decline in price. Expression of this quest was visible in the campaign against the "draft" which ended so disastrously to the producers, and, the wiseacres of that body having had their turn, some of the practical members amongst the tea-growing community are now beginning to raise their voices. As things stand, where the chief evil is over-production, economies must be looked for rather from within than from without, for the buyer knows he is in the stronger position, and he should therefore be cosseted and soothed rather than talked to with a club. But economies from within, in the shape of stopping leakages in profits, reducing extravagant charges, and rendering unnecessary too much manipulation of the article produced, are just those reforms that lie open to every tea-grower, and the closer he studies the minutiæ of his business the more he will fend off the reduction in his profits. Every decimal point per pound saved in cost of production and charges relating to tea is so much in his pocket, which he is more likely to save than if he attempted to put up market prices against the buyer.

Regarding the outlay on the estates, we cannot speak with knowledge, for that expenditure is of such a special character that experts alone can give an opinion worth having. As a matter of fact, however, we believe it is admitted that as, generally speaking, this expenditure has been steadily reduced, if allowance be made for exchange having risen, salaries have been cut down, more economical forms of working have been adopted, and in other ways

prime cost of production has been lowered. Whilst this has been done of late years, there has been a growing discontent with the burden of London charges, which range from a little over 1d. to 1¾d. per lb., and these charges upon an average price of 8¾d. for Indian tea and 8d. for Ceylon tea appear to constitute an excessive burden. They mean that the Indian planter has 7d. per lb. left with which to pay all working charges close down to the arrival of the tea at Calcutta and evolve a profit for himself, while the Ceylon producer has even less of a margin. Before we go further, we ought to say that in many cases the burden of the London charges is rendered unnecessarily heavy by the management at the estates. If the tea is not properly bulked before leaving the estate so that a break of chests of one grade differs materially in quality, "bulking" has to be conducted in the warehouses in London, and although this charge is said to be unreasonably high, the process necessarily must be costly, for all the chests have to be opened, their contents spread out, and mixed one with the other, in order to produce a tea of equal quality throughout the break. And the warehouse responsible for this work, if it does not do it properly, and it is often not done well, takes care that the samples taken shall not be from the best part of the tea, for in that case the buyer has a remedy against the warehouse, and this bulking in London, therefore, tends to hinder the tea-grower from getting quite full credit for the quality of the tea he sends. Then, again, tea loses in value by being handled, and the weight suffers from the same cause.

Another fruitful source of loss arises to the planter if he does not make the weight of his tares equal, the bare weight, that is, of the packages in which the tea is sent. If this precaution be neglected, the tea has to be "tared" in the warehouse, which means that the chests, or a certain proportion of them, are taken, the tea turned out, and the empty packages then weighed. The charge for doing this is also high, and, again, the loss in weight and damage to the tea in considerable. A saving can also be effected by so packing the tea that it takes less space in the ship, and thus reduces the cost of freight.

To give a concrete example of what attention to these details means, and also in elucidation of remarks to be yet offered about warehouse charges, we give the following examples of two shipments of tea by small Ceylon concerns, and the London charges upon them. The first example is one where the cost was low, amounting as it did to under ·96d. per lb. The names of the estate and of the ship are quite fictitious, although every other detail is copied with strict accuracy:—

ROTALE ESTATE CROP, 1899.

Report on Outturn of 113 Packages Tea ex *Oceana*.

Averages:—

		d.	
10,524 lbs. sold, grossing £319 11s. 1d.	=	7·29	per lb. gross.
10,640 lbs. shipped, netting £280 9s. 9d.	=	6·33	per lb. net.
116 Loss in weight and charges	=	·96	per lb.

	Equal to per lb. on Shipping weight.
	d.
Loss in Weight—	
Draft at 1 lb. per package accounts for 113 lbs. and the actual shortage is therefore 3 lbs.	
Draft and actual shortage equal 1·09 per cent. on shipping weight	07
Freight—	
Rate, 25s. Meast. 565. Amount, £14 2s. 6d. Equal to 941 lbs. per 50 cubic ft. on shipping weight	32
Dock and scale charges—	
Amount, £15 7s. 1d.	·35
Brokerage 1 p.c., and commission 2 p.c—	
Amount, £9 11s 9d.	22
Remarks—	
All grades passed on an average tare.	
Total charges and loss in weight per lb.	·96

In the above example all grades were passed on an average "tare," so that the tea did not have to be handled before it was sold. The result was that, allowing the 1 lb. per package for tare, the loss shown upon 10,524 lb. in the shipment was only 3 lbs., or nothing.

Turning to another shipment, which passed through the hands of the same agent, but from another estate, we find the result very different:—

BINGOLE ESTATE CROP, 1899.

Report on Outturn of 44 Packages Tea ex *Wakera*.

Averages:—

2,620 lbs. sold, grossing £'03 14s. 2d.	=	9·50	per lb. gross.
2,728 lbs. shipped, netting £91 13s. 2d.	=	8·06	per lb. net.
108 Loss in weight and charges	=	1·44	per lb.

	Equal per lb. on Shipping weight.
	d.
Loss in Weight—	
Draft at 1 lb. per package accounts for 44 lbs, and the actual shortage is therefore 64 lbs.	
Draft and actual shortage equal 3·96 per cent. on shipping weight	38
Freight—	
Rate, 25s. Meast., 124·8 Amount, £3 2s. 4d. Equal to 1,091 lbs. per 50 cubic ft. on shipping weight ..	27
Dock and sale charges—	
Amount, £6 6s. 7d...	·56
Brokerage and commission—	
Amount, £2 12s. 1d.	·23
Remarks—	
Each package tared involving heavy dock charges (tares 14– 18 lbs). Loss in weight is probably due to the same causes.	
Total charges and loss in weight per lbs....	1·44

In this shipment there were only forty-four packages, and so loss in weight from the draft was only 44 lbs, but, as a matte fact, 108 lbs. was lost out of the total amount of 2,728 lbs. ship Some little proportion of this was due to general causes, suc drying on journey and weeping, but the main reason was the that every package had to be tared at the warehouse. The sh age of tea on the shipment thus came to ·38d. per lb., instead of per lb., as in the first example. Taring also added to the w house charge materially, this representing ·56d. per lb, as aga ·35d. per lb. in the first example. The only respect in which Bingole shipment compared favourably with that from Rotale in that it was so packed as to allow 1,091 lbs. of tea to be got 50 cubic feet on boardship, as against only 941 lbs. per cubic of the Rotale tea, the difference representing 05d. per lb in freight charge. The net result was that the London charges the tea from the Bingole estate totalled 1.44d. per lb. as comp with only ·96d. per lb. upon the tea from the Rotale estate. probably the tea from Bingole was not in such good condition selling at the end as that from Rotale.

Whilst, therefore, we are not blind to the faults on the sid the planter and his assistants which contribute to keep the Lo charges heavy, we must confess to a strong opinion that he i some respects unjustly treated. Let us analyse these London penses as set forth in the examples given above. The los weight, after deducting the "draft," is a matter, as we shown, very much in the planter's own hands. Then comes o freight, which is a charge very much outside his control. Frei vary at times from about 20s. to 40s. per ton, and their rise and are governed by many conditions quite outside the tea trade, that trade cannot be expected to receive special consideration f the shipping firms. The examples we give show a freight ra

25s. per ton, and we believe the present charge is 30s. per ton. Next comes dock and sale charges. These are the warehouse charges about which there is so much complaint just now, and finally we have brokerage and commission. These latter embrace the usual 1 per cent to the broker who sells the tea and 2 per cent. to the agents, the latter covering office expenses and secretary's salary, if the concern is a company. The warehouse charge of 35d. per lb. does not look heavy to an outsider, and in the example we have given it is rather low, the average being nearer 40d. per lb. when no special services have to be rendered. When, however, millions of pounds of tea have to be handled in a year, this apparently infinitesimal charge mounts up to a considerable total, and we have good grounds for stating that it is unduly high. Space will not now permit us to enter upon our reasons for this opinion but they shall be set forth in another article.

STATISTICS RELATIVE TO TEA.

The *I. P. G.* gives "A Review of Some Recent Figures," Article No. 1 being as follows:—

Statistics as a rule are not appreciated by the general reader, yet to the student, banker, merchant or trader, they are not only of the greatest interest, but absolutely indispensable. To all connected with tea, the statistics now being regularly pubished are of the utmost value, enabling the producer, importer, dealer and buyer to gauge each the requirements of his own special branch of the business, and thus so to conduct his operations as will best tend to assure their success. In the earlier years of the industry it was greatly handicapped by the want of such statistics as are now regularly supplied—it was more or less a case of working in the dark and by rule of thumb or intuition, rather than on the solid basis of statistical facts. Order has, however, now been evolved out of what was before chaos, and all connected with, or interested in, the industry are plentifully furnished with accurate figures on which to base their calculations without fear of going in any way astray. What those beautiful, musical compositions, "songs without words" are to the musician, so statistics—which may be defined to be "facts without words"—are to the producer of, and trader in, tea. The great advantage of statistics when skilfully arranged either in properly tabulated statements or other appropriate forms is that they show "at a glance" facts which otherwise could only be gathered at the expense of great trouble and labour. Tabulated statistics of any produce are in fact to the producer and trader what a map of any country is to a traveller or student of geography. To all business men—merchants, directors, agents and planters alike—statistics are now a *sine quâ non*, without which it would be simply impossible to carry on the enterprise successfully. All matters connected with tea tend to a system of codification, as witness the amalgamation of a number of small estates into one big concern. It may be thought that we have a plethora of statistics, but such is unfortunately not the case. Although the movements of tea in London, Calcutta and Ceylon are fully given, we are still in the dark (comparatively speaking) as to actual statistics relating to warehouse and dock charges, etc. Although by this week's mail we have received the Custom House rules as to teas bulked in London, and the warehouse charges on tea, we require to be more fully enlightened as to the figures relating to the system in vogue at these centres, and it was owing to the ignorance of figures relating to weighments in the Customs that our Indian Tea Association in London so signally failed in the battle of the 1-lb. draft. The more the statistics we are fully furnished with on all points relating to the tea industry, the more power there will be to our elbow. Statistics are especially and pre-eminently the guiding star of producers, and without them they connot be advantageously placed in a position to fight the battles which are yet before them, and which have yet to be fought and won if the industry, so far as they are concerned, is to be placed on a better footing than its present precarious position. There is certainly a deficiency of figures in the majority of tea companies' published accounts, and it is owing to their paucity that the cash and other statements given are in most instances unintelligible. There is yet a vast field open and ample space for a larger array of figures than we are at present favored with. To cite a single instance, we have no means of finding out what the present season's average is to date for all the teas sold in Calcutta, in spite of the numerous brokers' reports. This may appear incredible, but it is a fact.

Before proceeding to consider the most recent statistics, we would make a note of the following, which are worthy of record for future reference:—

HOME CONSUMPTION OF ALL TEAS IN GREAT BRITAIN.

	Lbs.
1860	76,900,000
1870	117,625,577
1880	158,321,000
1890	194,009,000
1898	235,414,105

HOME CONSUMPTION OF ALL TEAS IN GREAT BRITAIN PER CAPITA.

	Lbs.
1868	3·52
1878	4·64
1888	4·95
1898	5·85
1899	6·00

The above figures are instructive and enable us to form a correct idea as to the progress made in the consumption of tea in the United Kingdom. The great expansion will be more clearly indicated as we proceed.

CONSUMPTION OF ALL TEAS DURING YEARS 1897-98.

	1898. Lbs.	Per cent.	1897. Lbs.	Per cent.	Difference. Lbs.
India	133,430,351	57	124,534,194	54	+ 8,896,157
Ceylon	82,471,745	35	85,493,552	37	− 3,021,807
China, &c.	19,512,009	8	21,372,030	9	− 1,860,021
Total	235,414,105	100	231,399,776	100	+ 4,014,329

Such was the statistical position of tea on the 1st January 1899. The total world's consumption of tea, excluding that in China and some other Asiatic countries, as to which there is no reliable information, may be taken for 1898, according to one of the highest London authorities, at from 600 to 650 million pounds. Of this quantity about three-eighths, 235½ millions—taking the population at 40 millions at 5·85 lbs. per head—were consumed in the United Kingdom, about five-eighths in other countries. In the United Kingdom 92 per cent. of the tea consumed was British grown tea, 57 per cent. being Indian tea. In other countries about 15 per cent. of the consumption was British grown, the balance coming from China, Japan, etc. The manner in which Ceylon vacated ground may appear strange, but there is nothing to be surprised at when we bear in mind her direct over-sea communication between Colombo on the one hand and Russia and North America on the other. The experiment thus made has been a surprising success, and Colombo with constant direct steamers to all the Australian ports also, now holds the key of *all* the chief tea markets of the world. Ceylon has lost no prestige, for although she sent three million pounds of tea less to the United Kingdom in 1898, the account is more than balanced by the seven million pounds increase in direct shipments to other ports. With regard to the great expansion in consumption of our Indian teas, this has been attributed to the great advantages Indian tea gardens have had of being worked with capital from London, the owners of the capital being of course under an inducement to stimulate the use of their tea, while the tea was produced in a British dependency by men whose domestic, financial and commercial relations were cast exclusively in the United Kingdom, where their tea was to be consumed. Things are very different in the other countries which Indian tea is seeking to enter. The consumers of tea there have no relations either of blood or finance with the growers of Indian tea, and have, therefore, no special inducement to spread its use. Entering strange markets without any support but its own merits, it naturally cannot but be expected that the contest for supremacy must be longer in those countries than it was in the United Kingdom, for there the old vested interests in China tea were met by the new vested interests in Indian tea, while in the foreign markets there is no such collision. In some of those markets China tea is supreme; in others Japan tea competes with it extensively; in others again Java tea holds the field. There are still others where tea from any country is not a popular beverage and coffee is in universal consumption. This is the case all over the European continent, with the exception of Russia, and perhaps to a small

extent in Holland, where Java tea is consumed. It has taken over twenty years for Indian tea to achieve the success it has and from this year only a door has suddenly opened for direct shipments to, and direct dealings with, outside ports and markets This has been the most significant feature of this season's operations in Calcutta. With regard to the falling off in the consumption of China tea, whether the importations of China tea into the United Kingdom will be much further reduced can only be treated as an open question. There are qualities of China tea which cannot be rivalled by the tea of India or Ceylon, and it is possible that those qualities will continue to be consumed by those who can afford to pay for them. A certain quantity is also still used for blending with stronger Indian and Ceylon teas. Whether the irreducible minimum has been reached cannot be predicted. Whether it will be found in from 20 to 25 million pounds, or in a much smaller quantity, it is impossibe to say.

Messrs. W. Jas. and Hy. Thomson, in their Annual Indian and Ceylon Tea Report, issued in June last, stated that, according to the Board of Trade Returns, we used at home, or sent abroad during the year 1898—

	Lbs.	Lbs.
Indian	141,000,000	235,000,000
Ceylon	94,000,000	
China, &c.	36,000,000	36,000,000
	271,000,000	271,000,000

and the firm estimated that the amount of tea that should be able to be handled in London during our present season 1899-1900, *i.e.*, up to the 31st May 1900, in London, would be as follows:—

	Lbs.	Lbs.
Indian	145,000,000	240,000,000
Ceylon	95,000,000	
China, &c.	35,000,000	35,000,000
	275,000,000	275,000,000

The population of the United Kingdom being some 40 millions, the estimate for Indian and Ceylon teas has evidently been based on the cansumption being 6 lbs. per head. As stated in a previous article, the actual amount available for export to London this season will probably be 127 million pounds of our Indian tea. There will thus be a shortage of 18 million pounds in the amount that could be absorbed by the home market. In the face of this more than probable fact, now that it has been fairly ascertained that we shall have a short crop of some 8 million pounds, prices should boom. The statement should certainly have a tendency to reduce stock, and such appears to be the case, for according to the latest wire stock on the 1st instant was only 35,574,000 lbs. against 36,059,332 lbs. in 1898. The drop in prices at the last auction sale, held on the 6th instant, can only be considered in the light of a temporary fall, due to a 5 per cent. bank rate at home exercising a blighting influence on business. On the opening sale after the holidays on the 24th instant, there is bound to be a reaction, and there will probably be a very appreciable rise in prices all round.

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

PROCEEDINGS OF A MEETING held at the Victoria Bungalow, 16th October 1899. Present:—Messrs. J. C. Abbott (*Chairman*), R. de C. Denny, C. Hall, P. W. E. Watts, G. H. Welchman, W. L. Ranking, A. R. Jones, and W. R. M. McKenzie (*Honorary Secretary*).

Roads and Bridges.—Read correspondance with Chief Engineer of Cochin and supervisor's replies.

Resolved—that the Association notes, with great regret, that the Chief Engineer has failed to fulfil his promise to place definite proposals for the repairs of roads before this meeting.

It was further resolved—that the attention of the Dewan be drawn to the deplorable state of the roads and bridges in this District on the eve of the despatch of crop, and that he be asked to request the Chief Engineer to put them into a passable condition.

Visiting Magistrate.—Read Secretary's letter to Dewan asking for the opening of a local court two days monthly.

Postal Improvements.—The Secretary was instructed to write to the Superintendent of Post Offices on the above subject.

Coffee-curing.—Read and recorded opinions of Coast firms.

Medical.—Read letter to Chief Engineer on the subject payment of funds expended by this Association in erecting a cary's bungalow.

Resolved—that the Chief Engineer be again requested to ar for payment of this account, and that copy of letter be s Dewan.

Resolved—that the Sircar be requested to allow the iron-r building in Nelliampathy bazaar to be utilized as a hospital for which there is urgent need, pending the erection of a perm hospital.

Paris Exhibition.—Read Vice-Chairman's letter.

Resolved—that this Association approves of his suggestion an effort should be made to obtain a grant from Governme behalf of the growers of coffee as well as for tea-planters.

Alteration of Rules.—Resolved—that in future five membe form a quorum.

Permanent Chairman.—This question was deferred to the meeting.

(Signed) J. C. ABBOTT,
Chairman.
(„) W. R. M. McKENZIE,
Honorary Secre

TRAVANCORE.

MINUTES OF PROCEEDINGS of a Meeting held at Poonmudi Bul low, 26th September 1899. Present:—Messrs. Cameron, Valent Ewart, Knight, Ross and Stewart. Mr. Cameron was called to Chair.

Office-Bearers.—The following office-bearers were elected for year. Chairman, Mr. D. G. Cameron; Secretary, Mr. R. Ross.

Chairman's Speech.—GENTLEMEN,—As you are aware, the Associa has been more or less dormant during the last two years and li work has been done, still essential matters have not been lost sig of by your Secretary, as the correspondence, files, and letter bo show. No doubt more might have been done by all of us; but absence of any very pressing need did, as it has a way of doi lead to a policy of inaction. It is now felt that this state of m ters should end. A difficulty of our Association, and one th neighbouring Associations are not always ready to recognize, is th of finding a convenient meeting place. We are so scattered, t length of the district being something like 100 miles, that atten ance at a meeting must involve to most men, a considerab expenditure of time and money. Trivandrum has been tried as meeting place, but by no means with unvarying success, and it w a happy inspiration asking Mr. Valentine for Poonmudi, and o thanks are due to him for placing his bungalow at the disposal the Association for to-day's meeting. Poonmudi is the most ce trally situated estate in the district, and, had it not been for illnes all but two or three members would have been here to-day. One the first questions requiring attention is our connection with th United Planters' Association. It is matter for regret that ou subscription is in arrears, and we all feel that the earliest opport nity should be taken to discharge this obligation. The able wor done by the United Association and the value of this work to th whole planting community of Southern India is too well known t you all to need enlarging on. In connection with the subject o bye-products, one of the most important of these appears to b Cardamoms. Being indigenous to the country, it naturally occu to one as less risky than any of those imported from abroa That it has not been taken up before is, of course, due to fisc conditions which, so far, render cultivation with us practically pro hibitive. I am not quite clear whether the revised cardamom rule of 13th July 1899 refer to this district or not, and it will be necessar to ascertain this. In any case, I feel sure that an understandin with Government is possible when this is found to be mutuall profitable, and that both interests are identical. There appears t me no difficulty in reconciling the two interests, and that this ha only to be clearly placed before H. H. Government, to ensure t us fair and equitable treatment. After your Secretary has had a opportunity of consulting with the other Associations in Travancore I hope to see a scheme prepared for your approval and the con sideration of Government. Another bye-product, which I should lik to see taken up, is Pepper, and I hope some one will set a good example with this.

Foreign Markets Fund.—The importance of this has so frequently and so fully been placed before you in planting literature, and i

) universally recognised, that I hope this Association may, in the ıture, as in the past, bear its share in the inevitable expenses. In ıis connection, I would like to refer to the greater interest taken y the Press generally in planting nowadays and to the benefits hich come from a free discussion and ventilation of subjects, pecially of moment to planters. In the old days, planting or plant-ıg-subjects were rarely alluded to in the Southern India press. low, not only have we an organ specially devoted to us, but the aily and weekly press give much of their space to the subjects hat are likely to interest or benefit us.

Roads.—Our wants in this respect are small, as compared with ormer years, but they are none the less important, and I trust H. H. Government will continue to treat these in the liberal and enerous spirit which have always characterized them.

Statement of Accounts.—The accounts having been placed on the able and examined show a deficit of Rs.166-13-0 due by the Asso-iation, exclusive of subscription to U. P. A. for 1898-99 overdue.

Arrears of Subscription.—Proposed by Mr. Valentine, and second-d by Mr. Stewart, that a list of arrears of subscription due by nembers be circulated and called in at date—that the money be laced at the credit of the Association to meet past liabilities and urrent expenditure.

Subscription to U. P. A. for years 1897-98.—Proposed by Mr. Ewart, nd seconded by the Chairman, that the subscription due to the J. P. A. for the year 1897-98 be paid; also that the subscription for 898-99 be paid at rate of second-class associations, and that this ate of subscription be continued.

Secretary's Expenses.—Proposed by the Chairman, and seconded y Mr. Knight, that for the year 1899 the allowances for stationery, ostages, and office expenses be fixed at Rs.120.

Foreign Markets Tea Fund.—Proposed by Mr. Valentine, and econded by the Chairman, that the Secretary be asked to circu-ate a subscription list on behalf of the Foreign Markets Tea Fund, nd amounts collected be sent to the Secretary of the Tea Fund ssociation, Calcutta, as per rates levied by Committee of above und.

Roads.—Proposed by the Secretary, and seconded by Mr. Stewart, hat the Secretary be asked to write and remind the Dewan that the rants applied for have not yet been sanctioned, that these roads re very important to the planting community, and the Association rust His Highness' Government will favourably consider the pplication. The roads are as follows:—

Poonmudi-Rockwood bridle path 7 miles.
Bon-accord-Augusteer District upkeep.
Augusteer-Kotour Tap road upkeep.

Cardamoms.—Proposed by Mr. Ewart, and seconded by the Chair-nan, that the Secretary of the Association put himself in communica-ion with the Secretary of the Peermad and T. D. H. Associations, vith the view to jointly approaching Government to remove the resent restriction on the cultivation of cardamoms on private roperties.

Vote of thanks to Secretary.—Proposed by Mr. Stewart, and econded by the Chairman, that a vote of thanks be given to Mr. Ross for having carried on the business of the Association for the ast two years without any support whatever from those interest-d, and, as the Association has been revived by this meeting, it is oped that the support of the members, so long withheld, will now e given.

(Signed) R. ROSS,
Honorary Secretary, T. P. A.

MARKET REPORT.

By Mail Advices of 29th September 1899.

COFFEE.

The London Commercial Record says:—There is no material hange to report. Ceylon gave way in value somewhat. Supplies f East India were moderate, and although no improvement in rices can be quoted, except for a few colory lots, there has been nore disposition to buy at current rates, and the greater portion of he quantity offered was disposed of. A fair demand has prevailed or Central American, which chiefly sold at about previous prices, old colory lots eliciting good competition. "Futures" have shewn nore strength during the week, and a smart rise of 1s 3d took place n heavy buying, brought about by anticipated smaller receipts, and although there was a slight reaction yesterday prices still shew some advance, closing as under:—

London ...	... Santos ...	December delivery	...	26s. 3d.
New York	... No. 7 Rio...	„	„	... 4·60 cents.
Hamburg...	... Santos ...	„	„	27 pf.

TEA.

Indian.—Rather less was offered at public auction, viz.:—44,600 packages, against 48,900 packages in the preceding week and 45,900 packages a year ago.

A firm tone prevailed particularly for good liquoring teas of all descriptions, which in many cases again ruled in favour of sellers. Common to medium leaf kinds with poor cup did not show much change, but brokens under 8d per lb. were freely taken up, fractionally higher rates being occasionally paid. Fine Pekoes and Broken Pekoes were in request, and together with finest tippy lines mostly fetched very full quotations. Among the best results were Assam:—Digaltarung Estate, 108 packages, 1s 1½d; Doom Dooma Co., 923 packages, and Makum Co., 113 packages 1s 0¾d; Borjulie Estate, Emp. I.&C.T.Co., 187 packages, Sonajulie Estate, Emp. I&C.T.Co., 118 packages, and Subansiri Estate, J. (A.) T.Co., 246 packages, 1s 0½d; Kuttalgoorie Estate, 118 packages, Lattakoojan Estate, A.T.E.Co., 299 packages, Mijica Jan Estate Maj.T.Co., 271 packages and Sealkotee Estate, 150 packages 1s per lb. Darjeeling:—Poo long Estate, 95 packages 1s 1¼d; Chong Tong Estate, A.T.E.Co., 85 packages 1s 1½d; Balasun Estate, D.C.T.Co., 155 packages 1s 0¾d; Moondakotee Estate, A.T.E.Co., 71 packages 1s 3¾d; Lebong Co., 898 packages 1s 1d per lb.

For 34,500 packages on Garden Account 8¾d per lb. was obtained, compared with 8¾d per lb. for 36,400 packages, and 9½d per lb. for 34,300 packages in the two former seasons.

The quantity submitted on Importers' account in September is:—

1899.	1898.	1897.
175,300 pkgs.	169,800 pkgs.	195,800 pkgs.

Ceylon.—Catalogues comprised 27,300 packages, contrasted with 26,900 packages on the 19th instant, and 23,100 packages at this period of 1898. There was a brisk demand and spirited bidding for nearly all grades at fully previous to slightly improved prices, the market being assisted by the desirable quality of a large portion of the shipments recently to hand. Ordinary Pekoe Souchongs and Pekoes were here and there ¼d per lb. dearer. Broken Pekoes with attractive flavour often brought ½d per lb. more on the lower to 1s per lb. on the finer parcels. Choicest Broken Orange Pekoe commanded enhanced figures, notably—Talawakelle, 1s 7¾d; Ingestre, 1s 6½d bid; Henfold, 1s 6d; Cannavarella and West Holyrood, 1s 4¾d; Hauteville and Lippakelle, 1s 4½d; Concordia and North Cove, 1s 4¼d per lb.

The average is 8¾d per lb. On the 21st instant, it stood at 8½d per lb., and 8⅛d per lb. in 1898.

Totals printed for the month are:—

1899.	1898.	1897.
114,300 pkgs.	86,500 pkgs.	89,600 pkgs.
(Avge. 7⅞d per lb.)	(Avge. 8¼d per lb.)	(Avge. 8d per lb.)

Java.—Only 418 packages of direct import passed the hammer prior values being well maintained. Slightly over 1,200 packages are advertised for the 5th proximo.

September sales included:—

1899.	1898.	1897
3,700 pkgs.	5.700 pkgs.	2,700 pkgs.
(Avge. 7d per lb.)	(Avge. 6¾d per lb.)	(Avge. 7½d per lb.)

Deliveries—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns continue to be satisfactory, viz.:—

	Lbs.
From 1st to 26th Sept., 1899	16,021,75
Do. do. 1898	14,496,65

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered
	Pkgs.	Pkgs.	Pkgs.
India	41,114	3.512	44.626
Ceylon ...	25,105	2,165	27,270
Java	418	—	418
Total ...	66,637	5.677	72,314

Also 562 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated September 29th, 1899, says:—

Quantity brought to Auction in London from 1st June to Date.

	Indian.	Ceylon.	Java
	Pkgs.	Pkgs.	Pkgs
1899-1900	413,580	380,512	20,23
1898-1899	380,914	429,875	15,64

45,089 *pkgs.* Indian
27,680 ,, Ceylon
418 ,, Java
} Total 73,187 packages were offered in public auction this week.

The high prices ruling for the lower grades of all Tea during the early part of this year had the natural effect of checking the export of Indian and Ceylon Tea to many of the foreign and Colonial markets. The inducement was rather for these markets to dispose of their stock at the profitable rates then obtainable, and to wait the opportunity of replenishing supplies which was pretty sure to come in the future.

Consequently figures showing the quantity of Indian and Ceylon Tea imported into markets outside the United Kingdom during the first six months of the present year are quite useless as an indication of the progress which is being made in these markets. In a circular issued a fortnight ago we printed these figures for purposes of general information, and in the following table the corresponding figures for the market of North America are shown.

Indian and Ceylon Tea taken in North America from 1st January to 30th June.

INDIAN TEA.

	1899.	1898.	1897.	1896.	1895.
Re-exports from U.K ...	1,112,573	1,106,886	1,175,979	623,317	819,560
Transhipments *viâ* U.K.	180,356	677,917	1,890,940	1,115,981	338,275
Direct expts. *viâ* China.	96,183	54,282	71,023	*not stated.*	
Direct do. from Calcutta	309,262	116,854	*nil*	*nil*	*nil*
Total lbs. ...	1,698,374	1,955,039	3,137,942	1,739,298	1,157,835

CEYLON TEA.

	1899.	1898.	1897.	1896.	1895.
Re-exports from U.K.	1,437,994	1,965,295	2,199,930	1,460,044	1,307,406
Transhipments *viâ* U.K.	161,294	876,124	982,759	564,790	383,127
Direct expts. *viâ* China	469,638	453,021	259,705	86,603	124,207
Direct do. from Colombo	1,367,614	995,964	*nil*	*nil*	*nil*
Total lbs. ...	3,436,540	4,290,404	3,442,394	2,111,437	1,814,740

These figures appear somewhat disappointing at first sight, but are not really so when the above facts are taken into consideration. It is a very encouraging feature that a large amount of buying took place in outside markets as soon as prices receded from the higher rates current last spring, and that a considerable business has since been transacted for several of these outlets, a strong demand from many quarters still continuing.

INDIAN.—Prices continue to harden and quotations for all grades are again slightly dearer, Teas for price being in special request. A glance at the following table giving the average prices of the different districts from 1st June to date, shows Assam to be nearly ¾d. per lb. behind last year, while owing to the dearness of Teas of the lower grade Cachar and Sylhet are more than 1d. ahead.

Some damage is reported to Tea property in Darjeeling through floods and earthquake, but full details are not yet to hand. The following averages are worthy of note:—"Poobong," 1/10¾; "Darjeeling Con. T Co. Balasum," 1/4¾, and "Amal T Co. Chong Tong," 1/4.

Week's av. of Tea sold on Garden Account 1899, 34,844 pkgs., av. 8·72d. 1898, 36,459 pkgs, av. 8·69d.

Total Tea sold on Garden Account 1st June to date 1899, 277,385 pkgs., av. 8·50d. 1898, 264,847 pkgs., av. 9d.

CEYLON.—Quotations are again higher, partly owing to the improvement noticeable in the quality of recent arrivals, and partly to the strong competition amongst buyers for all grades. The lower kinds are slightly dearer, while Teas of exceptional quality have been eagerly taken at better prices. The following averages may be mentioned.—"Drayton Est. Co D." 1/1, and "Henfold." 1/0½.

Average for week 8·..7d., against 8·15d. same period 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 784,924 pkgs., av. 7·95d. 1898, 872,772 pkgs., av. 7·65d.

JAVA.—The few Javas met with good competition and sold with a very firm tone, attention being attracted by some Djattinangor grown from Assam seed.

Bank Rate 3½ per cent. Exchange on London three months, sight:—Calcutta 1/4 11/32. Colombo 1/4 11/32.

PEPPER.

BLACK.—The market has been dull in tone this week, with business almost at a standstill. On the spot small sales of fair Singapore have been made at 5 9/16d; October-December shipment is quoted 5 13/16d sellers.

At auction on Wednesday 254 bags Singapore were bought in at 5⅝d to 5¾d, also 327 bags Penang at 5⅜d to 5½d. 1 bag Ceylon brought 5¼d per lb.

WHITE.—Is very quiet, and the only transaction reported is a sale of 10 tons Singapore near at hand at 8 13/16d.

At public sale on the 27th instant 20 cases fine Singapore sold at 10½d. 125 bags Penang retired at 8½d. 18 bags Ceylon realised 8¾d for good and 8¼d per lb. for mixed brown and blacks.

GINGER.

COCHIN.—Last week's private business included medium and bold Native cut at 50s to 55s, small cut 30s to 34s, medium and small washed rough 23s to 24s, and Calicut rough at 25s per cwt. Since then there has been a considerable falling away in demand, and sellers are much more in evidence than buyers. 422 cases 2,450 bags were catalogued on Wednesday which huge supply quite destroyed any thought of operating freely which might have existed in buyers' minds. The result was miserably poor, only 74 cases 265 bags selling in the room at easier prices, viz:—plump cut tips heavily limed 25s, small and leaner ditto 24s, good cuttings 17s, mouldy ditto 15s 6d; small to bold bright Calicut rough, in cases, 29s, smaller and leaner ditto, in bags, 26s, medium and small dull ditto 21s to 22s; small and ends washed rough rather dark 21s per cwt.

BENGAL: has been dealt in privately at 21s at which price 87 bags were bought in at auction.

JAMAICA.—22 barrels offered and 7 barrels sold—good boldish washed, part dull 70s, leaner ditto 63s, good medium 62s per cwt.

COCOA.

Auctions on Tuesday were uninteresting, barely 770 bags selling out of 3,600 bags catalogued; what enquiry there was emanated from all quarters, but the demand was soon satisfied without change in prices. Of 528 bags Trinidad offered 355 bags sold at recent values—71s to 73s for good to fine red. 208 bags Grenada found buyers at firm rates—fair red 64s. Of 83 bags Jamaica about 30 bags sold at 62s 6d to 63s for good and 58s for common, or about valuations. 128 bags Puerto Cabello, 35 bags Surinam, 20 bags Colombian, 665 bags African and 10 bags Seychelles all passed the hammer unsold. Of 1,510 bags Guayaquil brought forward barely 100 bags sold at 67s for Machala and 66s 6d for Caraquez, which showed an easier tendency. Of 85 bags Java only one lot of wormy sold at 51s 6d. 315 bags Ceylon offered but only 100 bags sold without change in value—fair to good bold and medium bright red 76s to 82s 6d, small 57s. Privately 200 bags Trinidad sold at 71s to 73s, 100 bags Grenada at 64s, and 500 bags Guayaquil-Caraquez at 64s to 66s 6d, Machala 67s and Arriba 68s to 72s per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

Foreign ...	57,443	56,602	48,458	70,218

INDIA RUBBER.

The market for fine Para closes rather quieter, but prices are steady. Further sales of hard cure, old import at 4s 4½d, and new at 4s 4d; soft cure, near at hand at 4s 2½d per lb. At auction to-day only small supplies were brought forward; there was a fair demand, and prices shew little change.

Colombian—9 bags sold, soft white scrap 2s 10d to 3s 1d.

Central American, &c.—49 packages offered and 43 sold, fair to good scrap 3s 0½d to 3s 1¼d, Guatemala tarry slab 2s 3½d, pressed slab and strip slightly mixed 2s 2d to 2s 2¼d.

Mangabeira.—30 packages offered and 9 sold—Santos, soft spongy sheet slightly mixed at 2s 4d per lb.

Mozambique.—327 bags offered and 102 sold—good to fine red ball 3s 5½d to 3s 6d, ordinary to fair red ball 3s 1d to 3s 3½d, unripe ball part soft 2s 2¾d to 2s 7d, sandy pickings 1s 6½d to 1s 7d; fine stickles sausage pressed clean 3s 6d, good ditto slightly sandy 3s 4d per lb. Lamu Ball, fair to fine 3s 1d to 3s 1½d, ditto rather soft 3s per lb.

Assam.—49 packages Penang and 48 packages and 1 case Para retired.

CARDAMOMS.

In better demand to-day at full-up prices. The following rates were paid:—Ceylon-Mysores, medium to bold fine pale, 3s. 2d. to 3s. 6d.; good medium pale, 2s. 9d. to 3s 1d.; small to medium ditto, 2s. 4d. to 2s. 6d.; small pale, 2s. 1d. to 2s. 2d.; small brownish, 1s. 8d.; good splits, 1s. 11d.; splits and pickings, 1s. 5d. to 1s. 6d. Ceylon-Malabar, lean brown, 1s. 9d. to 2s.; and pickings, 1s. 6d. per lb. Seed, according to quality, from 2s to 2s. 6d. per lb.

CINCHONA.

Amsterdam, September 28, 4-49 p.m.:—At the auctions held here to-day, 7,510 packages were offered (against 7,840 in August), of which 7,104 were sold at an average unit of 535c. per ½ kilo., as compared with 625c. in August. The following were the approximate quantities purchased by the principal buyers:—American and English factories purchased the equivalent of 10,204 kilos; Brunswick, 3,992 kilos; the Mannheim and Amsterdam factories, 4,341

kilos.; the Frankforton-Maine and Stuttgart, 4,770 kilos.; and various buyers, 4,479 kilos. The prices paid for the manufacturing bark ranged from 6c. to 61c. per ½ kilo., and for druggists', from 7½c to 64½c. per ½ kilo The tone of the market was steady at the decline.

The Vriesseveen cinchona-bark department at Amsterdam report the shipments from Java from August 22 to September 25 at 1,630,000 Amst. lbs.; and from January 1 to September 25 at 7,772,403 Amst. lbs. In the drug-auctions good thin Loxa quill sold at from 9d. to 10d. per lb., and Huanaco quill at from 6d. to 7¼d; 15 bales of flat Calisaya brought 6d. to 7¼d. per lb., according to damages; 13 bags of Cartagena sold at 2½d. for first-class damages and 3d. for sound.

QUININE.

Lower. The English and German manufacturers on September 23, reduced their quotation by 1d. per oz to 1s. 1d. for 100-oz lots. Howard's list prices are now 1s. 3d. in 100-oz. tins, and 1s. 4d. in vials in 1,000-oz. lots. Whiffen's prices are 1s. 1½d. in 100-oz. tins. Howard's quotations for the more important salts in 1-oz. vials are now as follows:—Hydrochloride 1s. 9½d.; hydrobromide, 1s. 9½d.; hypophosphite, 2s. 6d.; phosphate, 1s. 11½d.; salicylate, 1s. 9½d.; tannate, 1s. 2d.; and valerianate, 2s. 0½d. per oz. 100-oz. lots, in one tin, are charged 4d. per oz. less. The second-hand market has been quiet, and prices have again dropped. The business done this week being mostly for December delivery, at 10½d. to 11d. per oz., and on Wednesday there were sellers at the lower figure. To-day 15,000 oz. reported sold at 10½d. spot It is stated that makers will again reduce their quotation immediately after the Amsterdam bark auctions. Pelletier's brand is quoted 1s. 4½d.

VANILLA.

The bulk of the offerings to-day consisted of Seychelles, new crop, and practically everything was sold at full to dearer rates, the following being some of the prices paid:—Seychelles: good brown chocolate, 7½ to 8 inch, 28s.; 7 to 8 inch 27s; 7 to 7½ inch, 26s., 26s. 6d, 27s; 6 to 7½ inch. 25s. 25s 6d; 5½ to 6½ inch, 24s. 6d.; 4½ to 5 inch, 24s. 6d.; 5 to 5½ inch, 25s. 6d.

(AVERAGE FOR ALL INDIA 8·72d.) September 29th.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," Agra Bank Buildings, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 3rd Proximo. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *25th October.*—*Weather.*—More or less cloudy throughout week, but very little rain; some last Sunday; heavy rain in parts yesterday. *Crops.*—Gradually ripening-up. Preparations for picking in full swing. *Plant-diseases.*—The weather seems to be favouring the spread of leaf-disease. Some little borer is receiving attention. *Labour.*—Plentiful. *General Health.*—Good. *Interesting Item.*—Rifle meeting now on. Volunteer dinner at Club to-night.

TEA AND COFFEE STATISTICS.

In our last issue we reprinted an article from the *Indian Planters' Gazette* on "Statistics relative to Tea." As this was marked "A Review of Some Recent Figures" and numbered "I," we hoped to see in our contemporary's columns further remarks on this very important subject some references to a branch that it has so far neglected. Even in the second paper, however—published in our present issue—there is the same hiatus visible. With all that it has said, so far, we fully agree; but there has been in the two articles under reference a certain one-sidedness of view that might well be remedied. What we mean is that the Calcutta planting organ has dwelt entirely upon statistics of *consumption*, figures such as are put together in England rather than in India. Where we think there is most room for, and need of, improvement is in respect to the statistics of *production*, for which we must always be largely dependent upon planters themselves. Certain general remarks of the *I. P. G.* require but little alteration to make them applicable to both classes of statistics. "To all connected with tea" we read, "the statistics now being regularly published are of the utmost value, enabling the producer, importer, dealer and buyer to gauge each the requirements of his own special branch of the business, and thus so to conduct his operations as will best tend to assure their success." How much more valuable

would they be if they embraced really reliable statements of area under cultivation, estimates of crops, &c. "The great advantage of statistics, when skilfully arranged either in properly tabulated statements or other appropriate forms, is that they show 'at a glance' facts which otherwise could only be gathered at the expense of great trouble and labour. Tabulated statistics of any produce are in fact to the producer and trader what a map of any country is to a traveller or student of Geography." Yet a map that gives the elevation of mountains and omits rivers is, though useful for the specialist's purpose, not so useful for the ordinary student. Our tea statistics at present might almost be compared to maps of this kind: they give the figures of consumption with approximate accuracy, but not those of production.

As our contemporary observes, "to all business-men—merchants, directors, agents and planters alike—statistics are now a *sine quâ non*, without which it would be simply impossible to carry on the enterprise successfully." The full force of this statement is, however, only felt when the figures regarding both production and consumption are taken into account. The Director-General of Statistics in this country has tried to impress upon tea-planters the need for more accurate returns than are at present available. When statistics officially published are accompanied by an official warning that they are unreliable, they can scarcely be thought to be a *sine quâ non* to either merchant or planter. What is needed is that planters should lend a willing hand in a very useful work. At present there seems to be, in many quarters, a disposition to resent official requests for statistical information as inquisitorial. But, although the inquisitor who undertakes the compilation of statistics, must of necessity acquire a great deal of information that is rightly regarded as of a private character, statistics, in the form in which they eventually appear before the world, cannot be regarded as giving undue access to a knowledge of a man's private affairs. The objection referred to hinges upon a sentiment, or a fancy. As a matter of fact, every planter might contribute his full quota towards the statistics that are needed without in any way bringing his private affairs to the notice of the public. That the industry he is concerned in would benefit by the compilation of accurate statistics is, we think, beyond a doubt. At times it might seem as if revelations regarding anticipated large crops might hasten a decline of prices; but, if so, the contrary effect would be produced by statements showing a probable failure of crops, or by figures exhibiting a rapid increase of consumption.

The time is ripe for a full discussion of this subject. Such gentlemen as Mr. O'Conor, the Director-General of Statistics to the Government of India, and Mr. Stanton, the well-known London tea-broker, are manifesting an active interest in it. The Indian Tea Association has taken it up; the U.P.A.S.I. has been requested to do so. True, both these last two bodies have had the same subject under consideration before, and the planters of Southern India, in particular, have hitherto failed to respond to the call for statistics. There is still time for re-consideration, however. Perhaps, too, there is one view of the matter that has not yet received sufficient attention. We venture to assert that such statistics as are available are read with increasing interest year after year, even week after week, by planters themselves. If this be really the case, surely it is evident not only that accuracy of statistics should be encouraged and facilitated by planters themselves, but that they should realise that, if accurate statistics of consumption have a special interest for them, and accurate returns of production for tea-dealers and other non-planters, it is but fair that there should be reciprocity. At the present time, great care is taken in the compilation of statistics relating to the chief consuming markets of the world. Knowing this, appreciating and making full use of the result, planters ought certainly to reciprocate by endeavouring to provide the most reliable figures as regards production. Apart from the question of self-interest, this appears to us to be a duty that falls upon them. We trust that District Associations will take this matter in hand, that individual planters will come forward as volunteers, and that in a short time there may be no further ground for the reproach that the planter now incurs: that, though eager to profit by the statistics of others, he will do nothing in the way of reciprocity.

DR. GEORGE WATT'S TOUR.

After visiting Madras, Dr. George Watt, Economic Reporter to the Government of India, has travelled southwards. In a short time, however, he will arrive at Coonoor, and there begin, so to speak, the portion of his tour that relates to the planting districts. Travancore, the Lower Pulneys and the Nelliampathies are, we believe, outside the scope of his present visit; but he is to visit the Nilgiris, the Shevaroys, Coorg, and, if possible, the Wynaad. Mysore he will merely travel through. We append his revised programme:—

Arrivals.	*Haltings.*	*Departures.*
OCTOBER.		
Madras (Egmore)		Th. 26th, Oct., 7-25 a.m.
Villupuram, Th. 26th, 1-0 p.m.		Th. 26th, 1-20 p.m.
Pondicherry, Th. 26th, 2-50 p.m.	(Fri. 27th)	Sa. 28th, 9-40 a.m.
Villupuram, Sa. 28th, 11-45 a.m.		Sa. 28th, 1-17 p.m.
Cuddalore (N. T.), Sa. 28th, 2-37 p.m.		Su. 29th, 3-0 p.m. (O. T.)
Tanjore, Su. 29th, 7-56 p.m.		Mo. 30th, 9-35 p.m.
Negapatam, Tu. 31st, 12-30 a.m.		We. 1st, Nov., 4-35 p.m.
NOVEMBER.		
Tanjore, We. 1st, 7-45 p.m.		We. 1st, 8-20 p.m.
Trichinopoly, We. 1st 9-46 p.m.	(Th. 2nd)	Fr. 3rd, 6-0 a.m.
Dindigul, Fr. 3rd, 9-7 a.m.		Su. 4th, 4-15 a.m.
Madura, Su. 4th, 10-51 a.m.	(Su. 5th)	Mo. 6th, 11-16 a.m.
Tuticorin, Mo. 6th, 4-5 p.m.	(Tu. 7th)	We. 8th, 9-50 a.m.
Tinnevelly, We. 8th. 11-55 a.m.		Th. 9th, 9-25 a.m.
Trichinopoly, Th. 9th, 7-58 p.m.		Th. 9th, 10-10 p.m.
Erode, Fr. 10th, 2-55 a.m.		Fr. 10th, 5-8 a.m.
Podanur, Fr. 10th 7-38 a.m.		Fr. 10th, 8-0 a.m.
Mettapoliem, Fr. 10th, 9-24 a.m.		Fr. 10th, 10-0 a.m.
Coonoor, Fr. 10th 1-20 p.m.	(Sa. 11th)	Su. 12th,
(*If Train not available, by Tonga.*)		
Ootocamund, Su. 12th	(Mo. 13th, Tu. 14th & We. 15th)	Th. 16th,
Coonoor, Th. 16th		Th. 16th 12-15 p.m.
Coimbatore, Th. 16th, 4-16 p.m.		Fr. 17th 4-16 p.m.
Salem, Fr. 17th, 9-46 p.m.		Sa. 18th 6-0 a.m.
Shevaroys, Sa. 18th	(Su. 19th & Mo. 20th)	Tu. 21st 7-0 a.m.
Salem, Tu. 21st		Tu. 21st 9-14 p.m.
Jalarpet, We. 22nd, 12-21 a.m.		We. 22nd 1-15 a.m.
Bangalore, We. 22nd, 6-46 a.m.	(Th. 23rd) Gold Mines.	Fr. 24th 10-0 a.m.
Mysore, Fr. 24th, 4-51 p.m	(Sa. 25th)	Su. 26thby tonga.
Mercara, Su. 26th, or Mo. 27th		

From Monday, 27th November, to Friday, 8th December, Examination of Coffee Plantations, &c., in Coorg and Wynaad.

Madras, Sa. Dec. 9th. Visit Seven Pagodas Su. 10th, Mo. 11th & Tu. 12th. Depart by Steamer for Rangoon on Thursday, 14th December.

In the interval between arrival at Coorg and arrival at Madras, a visit to Wynaad will probably be arranged: but details of this part of the programme are for the present left open.

We may remark that Dr. Watt is most anxious for the success of the Commercial Museum at Calcutta. A branch has been opened in London, and time may yet see the opening of similar branches in Bombay and Madras. But this will depend upon the action of the merchants and agriculturists concerned. Several firms and others in Madras intend to avail themselves of the excellent opportunity Dr. Watt affords them to advertise their wares, as well as the products of the Madras Presidency; and it is hoped that the U. P. A. S. I., like the Indian Tea Association (Calcutta), will arrange for numerous exhibits of local products, and annual replacement of old samples by new.

COFFEE IN JAVA.

Mr. Frank Adam, of "Glen Nevis," Banjoevangie, Java, has sent the *Ceylon Observer* an interesting table giving prices of Java Government Coffee since 1827, as sold at Amsterdam, as well as those of Santos coffee as sold in Havre since 1885. It will be seen that the range of rates in both cases is very wide, but that Javas have maintained a considerable lead. The figures for 1899 show something like 59s. 3d. to 46s. 4d. per cwt. for Javas, against 31s. 4d. to 27s. 8d. for Santos. Still, the former prices do not appear very brilliant for a usually favorite "mild" coffee. As for a comparison of the courses of prices during the last twenty years—why, the fluctuations of Exchange practically render such a comparison impossible. The following is the table referred to, shewing *Highest and Lowest Prices*, respectively, in each year, from 1827 to 1899 (to date) for "good ordinary" Java Government Coffee (ordinary "East India" or dry preparation), at the Government auctions, held at Amsterdam. Prices quoted are in guilder cents per half, kilo.

Years.	Prices. Highest.	Prices. Lowest.	Years.	Prices. Highest.	Prices. Lowest.	Years.	Prices. Highest.	Prices. Lowest.
1827	34	26½	1852	27½	24	1877	58½	50

AN EXPERIMENTAL COFFEE GARDEN.

Having repeatedly advocated experimental cultivation on the part of both Tea and Coffee planters, we are naturally pleased to find that the Mysore planters are urging upon the Government the establishment of an experimental coffee garden. For some reasons, we should have preferred to see more of the element of self-help in the project; but, on the other hand, the State can do much more than private individuals in regard to certain matters. Mysore, too, has an Agricultural Chemist at its disposal, and Dr. Lehmann's advice and assistance will no doubt be found of the greatest value at the outset of such an undertaking as has been suggested. We feel sure that the suggestion will bear fruit, for the Mysore Government is as keen as planters themselves are on the development of the resources of the land, and is far-sighted enough not to allow considerations of ownershid to deter it from essaying progressive measures. Details of the scheme are given on another page, and will no doubt be read with considerable interest. At a time when the deterioration of E. I. Coffee is being debated, it is but right that its improvement should be actively taken in hand, not merely discussed as an abstract problem. It is not very long since we strongly advocated the importation of carefully-selected coffee seed from foreign countries with a view to improvement of the Indian berry. Until the present time, we had feared that our advice was deemed worthless; but from the scheme under reference we learn that a somewhat similar course is recommended. To the countries mentioned by Mr. Pilkington as growers of good coffee, we would add British Honduras at least; there are other countries where, we believe, coffee grows to perfection, but where it achieves but little beyond local fame, because of difficulties of transport, or labour, or other disadvantages that preclude the development of an export trade.

LABOUR EMIGRATION TO ASSAM.

The *Fort St. George Gazette* this week gives the text of (1) a Bill to consolidate and amend the law in relation to emigration to labour districts in Assam; and (2) The Immigrants' Health Bill. It is a coincidence that important legislation with respect to planters should be on the "India" and "Madras" anvils simultaneously. The chief of the new "India" Bills bears, to some extent, upon the Madras Presidency; but scarcely on the Madras planter. A certain amount of labour is drafted from this Presidency to Assam; but not from districts whence planters in the South draw their supplies. The chief reason for the introduction of the new amending Bill is the collapse of genuine "free emigration," and the growth of an unhealthy excrescence that has appropriated unto itself this same name. Government has been careful to reiterate its old assertion that its desire is to dispense with all special legislation relating to recruitment of labour for Assam. All who appreciate the necessity for waging war in order to secure peace, will see how it is that the dispensation arrived at is only to be arrived at by increased and ever-increasing stringency of legislative control. What will perhaps be of most interest to our readers, however, is the fact that the amended Bill provides for *raising* the minimum monthly wage of estate labourers:

Men from Rs.5 to Rs.6.
Women „ „ 4 „ 5.

This, at a time when South Indian planters have been meditating a *reduction* of wages, will come as something of a surprise: for the Tea industry of Assam, though certainly better off than the Coffee industry of Southern India, cannot be generally regarded as in a position to warrant increased liberality in the matter of coolies' wages.

PACKET TEA AT THE PARIS EXHIBITION.

The Ceylon men have decided that, if they are not permitted to sell packet tea at the Paris Exhibition, they will have a depôt outside the Exhibition premises. No doubt Indian planters will make similar arrangements, if necessary, but it is to be hoped that the delegates who have gone to Paris to try to bring about a change of policy on the part of the Exhibition authorities, will meet with success. Mr. J. H. Renton is to have direct control over the Ceylon Tea House with five servants under him. He wants more, by the way. It is estimated that each servant will cost Rs.1,000 for the whole period he is there. Details of the Indian Tea Associations' plans are not yet forthcoming, but we are glad to know that the London Association has fallen in with the suggestion that there should be a joint Tea and Coffee Room, not separate rooms for the two beverages. Thus, visitors to the Indian section will have a choice of tea or coffee, and when parties of friends wander round, one may be served with tea, another with coffee, according to taste. This may help to popularise the Indian section. It is about time, however, that definite plans were drawn up. If the Government of Madras follow the example of the Government of Bengal, and, if planters and firms interested in tea and coffee subscribe fairly liberally, South India may yet be able to make a decent show at Paris. At the same time, it seems only too probable that South Indian Coffee will not be able to take up, and will not even try to assume, its proper position, as a rival of Indian Tea. If the industries were to be judged by the comparative importance of the probable exhibits of the two products, Coffee would probably appear quite insignificant. That it is not so, even in India, is known to all who watch trade statistics. At the same time, we must acknowledge that the coming of Indian Tea appears to be in full swing, and, though we are no believers in the passing of Indian Coffee, there has been at least a temporary shrinkage in the volume of trade.

GUTTA AND RUBBER IN BRITISH NORTH BORNEO.

We quote to-day a report of the North Borneo Commissioners of Lands on Gutta and Rubber in those parts. The details of the process of collecting gutta are very interesting, and the whole report appears to show that conditions for the cultivation of this product in North Borneo are exceptionally favourable. After studying Mr. Walker's remarks and accounts of gutta cultivation in other countries, we certainly cannot recommend planters in Southern India to choose gutta as a bye-product, or an auxiliary. Nor do we think that, speaking generally, rubber offers much more inducement. Experiments are being conducted with this article, however, and there is a possibility that some variety may be found to grow satisfactorily in some parts of the planting districts. Official experiments have led to somewhat gloomy official reports; private experiments have, so far, been carried on with very careful regard to secrecy; but it should not be very long before news becomes available as to whether rubber will or will not "pay" in Southern India.

NOTES.

Travancore Tea. Messrs. Finlay, Muir & Co. are advertising for contractors to build two large tea factories in Travancore.

Game Preservation in Mysore. Draft rules on this subject have been prepared and are now before the Durbar awaiting sanction.

Tea Machinery in Ceylon. The Ceylon Government has stated that it has no intention to charge import duty on tea machinery.

Lipton's Defeat. The flutter in the *American* dovecote has subsided, for the *Columbia* has won. We might have prophesied this, for all the world knows the America Cup is something very different from Tea-cup!

Planting in Queensland. From a report on the last Cairns A. P. and M. Show we take the following:—The exhibit of Mr. W. G. Thomson was one of the most instructive of any. It consisted of four distinct varieties of pepper creepers (with specimens of their products), a species of vanilla, and a sample of India rubber. So far none of these valuable plants have been *cultivated* in this district, where they grow wild, but Mr. Thomson intends taking in hand this important work, and there is scarcely any reason to doubt that large and important industries could be established from them.

The London Tea Market. Cable advices, dated 19th instant, from Messrs. Gow, Wilson and Stanton recorded "a dull tone generally among buyers," and a weak market. The average of Ceylon Tea for the week was 7⅞d. (⅛d. down). Indian, according to Reuter, averaged 8¾d. (⅛d) up. Of 25,000 packages Ceylon Tea offered, 23,000 were sold; and of 48,000 packages Indian, 42,000 found buyers.

Production of Tea in Japan. From official reports of the Japanese Government, we find that in 1897 there were 777,944 households engaged in the production of tea. The quantity produced was larger than in 1892 by over 10,400,000 pounds. During the three years, 1895, 1896, and 1897, the average annual production was 8,556,569 *kwan* (8·28 pounds), or 70,848,391 pounds. The wages of tea workers have increased from an average of 31 cents per day in 1892 to 42 cents in 1896.

Rejected Tea in the U. S. It appears that the first crop new Japans lately rejected by the U. S. customs authorities were condemned owing to excessive coloring matter, and it is said that many teas have been imported and passed which have attracted careful attention from the Tea Examiners, as the quality was just on the line of value with the Government standards. This close relation of quality on first crop requiring almost a rejection may cause many teas of second picking of same quality, but drawing darker liquor, to be rejected.

Cultivation of Cannabis Indica. The Mysore Government have decided to teach the local ryots the most improved method of cultivating *Cannabis indica* and the manufacture of bhang. The decision has been the outcome of an anxiety to augment the revenue of the State. The Excise Commissioner in Mysore has obtained the sanction of the Madras Government to obtain two experienced growers, and the best seed is also to be procured. There is likely to be difference of opinion, observes the *Chemist & Druggist*, as to whether it is wise to train the Mysore ryots in the cultivation and manufacture of such highly noxious drugs.

A Laboratory for the Agricultural Chemist Mysore. We had thought that Dr. Lehmann's Laboratory had been ordered already, but seemingly this is not the case, for, when at the meeting of the Mysore Representative Assembly, Mr. H. Pilkington, of the North Mysore European Planters' Association, thanked the Government for having appointed a Government Agricultural Chemist, and said that, to enable that officer to carry on his investigations of plant-diseases and analyses of soil, a well-equipped Laboratory should be fitted-up as soon as possible, the Government replied that it would do this on the application of the Agricultural Chemist.

Cheap Coffee. Now that Coffee is cheap, there are the customary insinuations as to the cheapest sorts. Whatever is cheap is necessarily nasty, in the opinion of some folk. On this principle, it is now alleged that cheap coffee is dangerous to health, and that it is the custom to use Paris green "in coating the cheaper grades of coffee. Pickers are employed to go over the coffee and pick out the Paris green, but they will occasionally miss a chunk about the size of a grain of coffee. This gets into somebody's coffee, and there is a poisoned family as a result." Perhaps the story will have one good effect at least: it may put people off so-called "coloury" coffee a bit.

Tea in Australia. The total quantity of tea imported into Australia from all ports up to the 27th ultimo was 14,689,967 lbs., as against 13,525,848 lbs. at the same time last year. Stocks in bond at Melbourne on the 16th ultimo were 2,259,480 lbs., and at Sydney on the 22nd idem about 2,000,000 lbs. The business done during the month of September was steady, the demand running almost entirely on teas for price. It is remarked, however, that the quality displayed by Indian and Ceylon teas, grading from medium to fine, has not been such as to attract keen competition; and, according to Messrs. Alfred Harvey and Co., Melbourne, buyers would be glad to see a sprinkling of really good teas in future shipments. We are glad to see that China tea also are referred to as of inferior quality this year.

An Appreciation of Planters. Mr. Cotton, the Chief Commissioner of Assam, says in the official report of his recent tour:—"It seemed to me that the tea plantations were, if I may use the expression, on a happier footing than they used to be in former years, as if the improvement in the financial prospects of tea cultivation had communicated itself to every part of the industry. The coolies looked happy, well and contented, and for the most part appeared on excellent terms with their masters; these, too, as if they had become more hopeful and more satisfied with their position, seemed to think more about making themselves comfortable. Their houses were better kept, pains had been taken to attach good vegetable gardens to them, and here and there pretty flower gardens were making their appearance. Tea-planting certainly never appeared to me in so inviting an aspect before."

Ceylon Tea at the Paris Exhibition. The local Committee of the Exhibition has consented to meet the cost of the tea kiosque, the royalty, and the five native servants who are to go to Paris, and another effort is being made to get the French authorities to concede the sale of packets of tea. The *Times of Ceylon* remarks:—Arrangements should be made, as many months beforehand as possible, on a large and general scale, with outside restaurants, to stock and sell our tea in cup and packet. Such arrangements should be perfected by assistance obtained on the spot, or sent over from London, at once, for this side of the matter has unfortunately been practically overlooked. The planters' representative was needed in Paris for the first half of this year, quite as much as he will be for the first half of next year; and, had he been there, it would have made a great difference to the results.

Tobacco. "Experimental Planter" writes to *Indian Gardening*:—"I am at a loss to understand why planters in Southern India do not take up tobacco culture as an "auxiliary" to coffee. It is an easy crop to grow, and the entire field could be sold, as it stands, to any of the large cigar manufacturing firms at Madras, or Trichinopoly, leaving them to do the harvesting, withering, and curing (I believe the withering *must* be done on the field). My experience with tobacco cultivation—only experimental, it is true—has been that a soil that will grow coffee

will grow tobacco. There is always a brisk demand for well-grown tobacco, even if the crop is sold to native vendors, of whom there are so many in Southern India. Some one the other day recommended Assam and Sylhet planters to go in for tobacco culture as a "bye-product" of tea—of course, he meant "auxiliary." But Assam and Sylhet planters have their hands pretty full just now with fibres, Vanilla, etc., etc."

South Indian Tea in Colombo.

Some South Indian Tea having been placed on the Colombo market, in bond, for sale, the *Times of Ceylon* has a little grumble, and remarks that any considerable extension of the movement is not calculated to benefit the Ceylon producer selling in the local market. It submits that the advantages which the Colombo market offers to others should be paid for, on the same scale that the Ceylon planter pays for them, and which the advertising of our staple throughout the world has mainly produced, and maintains. "As soon, therefore, as three or four others follow the example, which has been set, the time will certainly have arrived for enquiring whether means cannot be devised whereby the Indian product sent here may contribute its quota to strengthening the market which is benefiting it, and which it will otherwise weaken. It would be perfectly reasonable and just for the Thirty Committee to call upon the authorities to add to Ordinance No. 4 of 1894 a provision that teas brought to Colombo and deposited in bond for purposes of re-exportation should be required to pay the same cess of 20 cents per 100 lbs."

The Bandong Quinine-factory.

A correspondent of the *Batavia Niewsblad* states that Dr. Van Linge has left the Pandan-Aroem factory to join the staff of the Bandong-works. It is said that the working of the Bandong factory for the first half of the year has been very profitable, and that, if business continues as it now is, a good dividend is likely to be declared at the end of the year, in which the planters who have contracts for the supply of bark, will participate. As a proof that confidence in the factory is growing, it may be mentioned that the Tjimonteh plantations have promised to supply 25 tons of bark, and there are many other promises averaging 30, 40, 25, and 10 tons each. As to production, the Bandong factory have dealt with 506 tons of bark from January 1 to August 21, which has yielded over 21 tons (752,640 oz.) quinine-sulphate. Since January 1 the factory has "worked" about 2½ tons to 3 tons of bark per day, the present capacity being 4 tons per day, which, however, can readily be increased to 6 tons if required. The monthly output is, therefore, from 100 to 150 tons. With reference to the auction which is to be held in January, it is thought that the chance of success will be greater if, instead of one auction, a series be held; but nothing definite has yet been decided on.

Pepper in Assam.

A Sylhet correspondent of *Capital* writes:—The Dictionary of Economic Products does not mention black pepper being cultivated in Assam. the only reference made is to the effect that black pepper (*Piper nigrum*) is doubtfully indigenous to the province. But according to the *Agricultural Ledger*, 1898, No. 7, black pepper does not appear to occur in the wild state in any part in the Assam valley, but an allied species (*P. longum*) is so found. It is not cultivated extensively in any part of Assam, and not cultivated for the market, all the Assam supply coming from Calcutta. Black pepper is considered a valuable adjunct to the coffee gardens of South India, some of the planters even looking upon it as their staple product; and there is no apparent reason why Assam should not grow the whole of its own consumption as well as have a good deal to spare. By the way, the pepper grown in Assam, although much lighter to that grown in Bengal, is considered of better quality, and it is possible the Assam cultivators do not pay sufficient attention to collecting the crop as the fruit begins to ripen. If collected too young, or allowed to hang too long after being ripe, the pepper deteriorates in solidity, and consequently in value, as the quality is determined by the weight of the corns.

Coffee as a Beverage.

Some little time ago the *Medical Review* remarked:—The effects of the persistent use of strong coffee are very marked, the early symptoms being profound mental depression (!), sleeplessness and head-ache, muscular debility, trembling irritability of the heart's action and a form of dyspepsia. If that is not enough to frighten the coffee maniac there comes incessant dread, the countenance becomes *triste* and the legs and feet cold, whilst erysipelas and other acute inflammations are easily contracted. Sooner or later, too, he will give way to alcoholism, when he finds the stimulating effects of coffee fail him. "Neurasthenics are the most liable and give way most easily to the immoderate use of coffee, supervening, in consequence, melancholy, mental depression and suicide. The Moors are great coffee-drinkers and their sight begins to give way gradually when 45 years of age, whilst at 50 they are blind, all on account of coffee." Commenting on this, the *Brazilian Review* says:—Perhaps that accounts for so many blind beggars in our streets, too, but scarcely for the pox-marked faces. Anyhow, we doubt if coffee is anywhere more indulged in than in Rio de Janeiro, and, though we can scarcely be termed a robust community, the abuse of coffee cannot be half as dangerous as that, equally common, of alcoholic stimulants and, so far from any one being brought to indulge in alcohol from excessive drinking, the two are absolutely antagonistic; coffee, on the contrary, being always regarded here as a corrective of alcoholism.

New Rubber Plants.

The Collectors for l'Horticole Coloniale have sent home some new and interesting "Rubbers" from hot regions, and also some seeds, which have already germinated, of a valuable species coming from cold districts where Jean Linden discovered it sixty years ago, growing at an altitude of from 6,000 to 8,000 feet. This species yields caoutchouc the fifth year after planting, and it can readily be acclimatised in the South of Europe and North Africa. The *Semaine Horticole*, which mentions the above fact, speaks also of a tree to be shortly imported, which is alleged to be as powerful as Eucalyptus in rendering tropical swamps less noxious, and the seeds of which constitute a new febrifuge as efficacious as quinine, and infallible for snakebites. Mr. Thomas Christy makes an equally interesting statement saying:—"It has been known now for some time that there is, on the East Coast of Africa, a plant, the root of which cures blackwater fever, this quotation on the authority of an English Surgeon, who has well worked out the subject. He has sent home a hundred pounds of this root, which is evidently a plant of the acacia tribe, judging from the pod which arrived, in a rotten state, in the package. We have treated a certain quantity of this root in one or two

ways, so as to bring it as near to the fluid extract as possible, because the Surgeon stated that, when he first found this bark, it was to cure one of the native bearers on an expedition, and, thinking that the man would be dead in the morning, he spoke to the headman in charge of the coolies when, to his surprise, he said : " Oh, the man will be perfectly well in the morning ; I will give him a dose." He went with this man, dug up the roots, and watched the roots boiled down and the decoction given, and the result was as indicated, the man was well in the morning and able to carry his load. A supply of roots having been secured, they were tested on the East Coast, and, in every instance, found to be efficacious upon Europeans. We are sending out some of this fluid extract to be tested in cases of yellow fever in Brazil, and we are supplying different parties who have establishments on the East and West Coasts of Africa."

The American Market for Tea.

Mr. J. Brown, of the firm of Bronson, Brown & Co., in referring to the tea market, lately, remarked :— " Business seems to be good, though done at very close figures. Margins on teas never were so close, and are now reduced to mere commission, and any firm not willing to trade on this basis will have to stop. Competition from all sections is equally severe, and we expect but little as the result of our best efforts. The new crop teas, as a whole, so far as shown, are not better than last season's. Oolongs lack body, and the lower grades are weathery, and were they not new would surely be rejected. Messrs. James & John R. Montgomery & Co. report the statistical position of tea for United States and Canada as follows :—

	Pounds.
Total afloat to September 1, 1899	4,499,060
Receipts to September 1, 1899	19,706,752
Total shipment advised by mail	24,205,812
Leaving to be shipped	62,794,188
Estimated supply, seasons 1899-1900	87,000,000
Supply, seasons 1898-99	82,907,867
Supply, seasons 1897-98	87,711,780
Supply, seasons 1896-97	93,551,353
Afloat, September 1, 1898	4,525,882
Receipts to September 1, 1898	20,986,740
Total shipments advised by mail to Sept. 1, 1898 ...	25,512,622

The imports of tea into the United States during July, 1899, as reported by the Tea Association, were 6,796,110 pounds ; for the seven months ended July 31,36,125,095 pounds. Withdrawals during July, 7,097,299 pounds ; for the seven months ended July 31, 38,523,326 pounds. Stocks in warehouses in United States on July 31, 26,765,803 pounds ; stocks in bonded warehouses same date, 17,236,284 pounds.

South Travancore Tea Co.

The report that was to be presented at the third annual ordinary general meeting to be held at the offices of the Company, 16, Philpot Lane, on Monday, the 2nd October, says that the outturn of tea was 337,961 lbs., being 37,961 lbs. above the original estimate, against 242,046 lbs. last year. The average price realised was 6·03d. per lb., as against 5·55d. last year and 5·85d. the year before. The gross profit was £3,339 15s. 10d., against £1,304 15s. 3d. last year and £1,672 11s. 10d. the year before. After writing-off the whole of the preliminary expenses and cost of debenture issue, amounting to £521 8s. 4d., and after providing £250 for the debenture sinking fund, the net profit amounts to £1,794 10s. 10d., which, with a balance of £185 15s. 4d. carried forward from last year, leaves a sum of £1,980 6s. 2d. which the directors propose to dispose of as follows:—

	£.	s.	d.
Preference dividend for the year ... ... (Of this £412 10s. has already been paid.)	825	0	0
Dividend at the rate of 5 per cent. on the Ordinary Shares	687	10	0
Leaving a balance to be carried forward of ...	467	16	2
	1,980	6	2

During the past year the directors effected the re-sale of two outlying portions of land to the vendor, Mr. H. M. Knight, for the nett sum of £1,985 2s. 0d. The area under tea now amounts to 722 acres. In accordance with the resolution of the special meeting, held 4th January, 1899, an issue of £6,000 mortgage debentures was effected, and, with the money so realised, the directors paid-off the company's debt to the Bank and put the affairs of the company into a sound financial position. The reports on the condition of the company's properties from the manager and the visiting agent are of a most satisfactory nature, and point to a continuance of the prosperous course which the company appears to have now entered upon. Great credit is due to the company's Manager, Mr. Stewart, and the Assistant, Mr. MacDonald, for the satisfactory character of the past year's working. The estimate for the present season is 350,000 lbs. Mr. H. M. Knight, in consequence of prolonged absence abroad, resigned his seat on the Board early in the year. In accordance with the Articles of Association, Lieutenant-Colonel C. F. Colvile retires by rotation, and, being qualified, offers himself for re-election. The directors of the company are Mr. T. C. Owen, Lieutenant-Colonel C. F. Colvile and Mr. A. Y. Holland.

LETTERS TO THE EDITOR.

SPANS OF ROOFS.

Sir,—In reply to the letter of " Novice," in your issue of the 21st instant, I take it that it is required to cover a room 40 feet wide, as, if the room is only 20 feet, as appears probable from the letter, no pillars will be necessary. The pillars should be 18 inches square (two bricks) for safety, standing, as they do, alone—a brick-and-a-half = 13½ inches—will not be able to resist much lateral pressure. A double gable would be better than a single span. I am not able to say, definitely, whether the outward pressure would be too great for an ordinary king-post or not. I have here a room, 30 feet wide with 2 feet square pillars in the centre, under one span. The tie-beams are of vengay and 6½ × 4 inches only, without any clamps whatever. It has shown no signs of weakness after twenty-five years ; so that, with 9½ × 4 inches tie-beams clamped to the principals, evil results from outward pressure need hardly be feared. The water-shed, however, over so large a span, with reepers and estate-made tiles, may give rise to leaks ; and for this reason, if for no other, a double gable is advisable. A one-inch iron rod, passing from end-to-end of the tie-beam, with a bridge in the centre, is now frequently used to obviate lateral pressure.

Thomas Brown.

GENERAL ARTICLES.

PLANTERS AND GOVERNMENT IN MYSORE.

We are glad to see that the relations between Planters and Government in the Mysore State continue to be of the pleasantest. At the meeting of the Representative Assembly this month, Mr. E. Playfair, Honorary Secretary, South Mysore Planters' Association, said that the South Mysore Planters' Association, which he had the honour to represent, desired him to express its appreciation and thanks to the Mysore Government for the effective manner in which they have kept plague out of the district during the past year. Had it invaded the district, serious inconvenience would have been experienced in transporting produce. They noted, with pleasure, that a re-survey of the Arsikere-Mangalore Railway had been sanctioned, and they hoped that a connection with the natural outlet of this province might shortly be established. He had to thank the Mysore Government for its letter regarding the Paris Exhibition and distribution of Mysore produce there. A meeting of the Association had been called for the end of this month, when they would discusss and settle how they can best meet the wishes of the Mysore Government. He had only to express regret at the absence of Sir K. Seshadri Iyer, who, he hoped, very soon would be convalescent. In reply, Mr. Thumboo Chetty observed that the Government had always done all it could in the interests of planters, and would continue to do so.

Later, Mr. Pilkington, of the North Mysore Planters' Association, raised a very interesting question. He suggested that an experimental coffee nursery might be established, and said that for many years the Mysore Arabica Coffee flourished in this province and made the name of Mysore as a coffee-producing country famous throughout the world. This type of coffee spread, it is generally believed, from the historic plants growing on the Bababadungiri all over Mysore. For many years this strain held its own both for quality and vigour, but when in the 70's leaf disease came in, it showed signs of weakening, obeying apparently the law of plants that cultivated strains must wear out. Thus followed, as is well-known, the introduction of the Nalknad-Coorg strain to replace the worn out "Chick." At the present time, however, signs were not wanting that the hardy and prolific Nalknad strain was, in its turn, losing its vigour, and it behoved the industry to try, by every possible means, to forestall this by finding and introducing a new strain to take its place, just as the Nalknad replaced the old "Chick." Unfortunately, Nature had not, so far as was known, again come forward with a new robust and prolific strain of her own that may be substituted for the Nalknad ; but there were scattered about in various plantations young hybrid plants of "Liberia-Arabica." Chance plants like this, as was well-known, cannot be relied on to establish a new and distinct strain of hybrids. They require to be collected and watched and gradually assorted, and distinct strains established after three or four generations of seed. This, then, was one possible source from which a new strain may be obtained. In Central and South America coffee leaf disease has not, fortunately for those countries, occurred. And as coffee of fine quality is grown, particularly in Costa Rica, Guatemala and Jamaica, seed might be obtained from these countries and carefully tried and tested in this climate, and every endeavour made to ascertain if any of them would be able to resist leaf disease and be suitable for replacing the Nalknad. These coffees would if suitable, have an advantage over the hybrids, as they were established strains of high quality and well thought of in the European markets ; whereas, it remained to be seen how the hybrid bean would be received and what price would be obtained for it. Unfortunately, experiments of this kind cost money, and it is to aid them that Mr. Pilkington was appealing to the Government on behalf of the Mysore Coffee Industries which, owing to the fall in price, are in danger of extinction in many cases. He had been provided by his Association with a scheme for making these experiments, which he hoped he might be allowed to lay before the Durbar ; and knowing the deep interest taken by the Government in all the Mysore industries and the wise and fostering care bestowed on them, the Mysore Associations trusted that their appeal on behalf of this industry generally, which had made the name of Mysore famous long before its gold had rendered it so, and which might be said to have civilised the Western Districts of the State, would not be made in vain.

The following is the scheme referred to in the above speech :—(1) That Government provides free of tax, a suitable piece of land in the Coffee District—from 20 to 40 acres might be required—and near some well known planter who would undertake the care of the same. (2) That a list of the countries from which suitable seed may be obtained be prepared by the North Mysore Planters' Association in conjunction with Dr. Lehmann and Dr. Barber, of Madras (he being in direct communication with Kew), and half a bushel of each description of first-class seed from a reliable planter or through the Consul, be obtained. (3) That samples of the different hybrids not existing in South India be obtained that they may be scientifically assorted and strains, if possible, established. (4) That the Committee of the Association after consultation with Dr. Lehmann and Dr. Barber, appoint some well-known planter, in whose vicinity the land is, to superintend and arrange for the working of the same ; and that Dr. Lehmann visit the place as often as he conveniently can. (5) That nurseries be formed of the seed obtained in due course ; and one-acre plots of each variety be planted up. The balance of the nursery plants to be sold, if possible ; and it is probable, if they were healthy plants, that there would be a ready sale for them, it being already difficult to obtain strong young plants of the Nalknad. (6) In the event of any of the plots planted out from imported or hybrid seed turning out strong healthy coffee seemingly capable of resisting disease and of bearing good crops, a large return from sale of seed would result, and the experiment might eventually become self-supporting. (7) That Government allow a sum not exceeding Rs.200 per mensem to cover cost of seed and working the nurseries and experimental plots. The following is an approximate estimate of cost :—

	Rs.
(1) 5 bushels of different seeds at Rs. 40	200
(2) Purchase of hybrid plants, say	100
(3) Making and keeping up the nursery for one year (including Overseer)	800
(4) Clearing and planting 6 acres of jungle	600
Total ...	1.700

The Government replied that the subject would receive consideration in due course.

Mr. A. Shama Rao, of the North Mysore Native Planters' Association, and other planters, represented that the minimum extent of 15 acres prescribed for *darkhasts* for coffee cultivation might be reduced to 5 acres. They submitted that

some three years ago it had been usual to allow 5-acre plots of lands for coffee cultivation. But since then the Government made a rule that, when cultivators relinquished lands under coffee cultivation, their resignation should not be accepted unless they relinquished plots of 15 acres at a time, because the Government had, at great cost, provided facilities for the prevention of coffee-stealing. This rule in regard to relinquishment, led to the revision of the *darkhast* rules so as to raise the minimum from 5-acre plots to 15-acres. The representatives contended that accepting resignation was quite a different thing from giving facilities to poor coffee planters to make a living from cultivating small plots. In Malnad, people could only carry on paddy cultivation for their livelihood, and it was necessary that every one of the Malnad ryots should cultivate small plots of coffee lands as an additional source of livelihood, for, in the absence of coffee cultivation, the paddy cultivated could hardly enable them to make a living. The Government said that the matter would receive consideration.

Mr. Davood Saheb, of Mudigere Taluk, and Mr. C. Srinivasa Rao, of Chickmagalur, represented that the restriction against the grant of lands for cardamom cultivation in the Malnad within fifty yards of water-courses might be withdrawn. They submitted that, in most cases, it would be found, on careful enquiry, that, owing to abundance of water-supply in the Malnad, the cultivation of such lands with cardamom would not affect the supply of water to any irrigated lands and could not therefore be objectionable. As cardamoms wanted a plentiful supply of water, it was advantageous to cultivate them by the side of water-courses. One of the reasons adduced by Government in support of the restriction was that, if the cultivation of cardamoms were allowed within fifty yards of water-courses, people encroached on reserved lands and cut trees, undergrowth, &c., thus leading to denudation of forests and consequent diminution in rainfall. The representatives contended that the theory of Colonel Campbell Walker in this matter was not altogether agreed to by all, for the theory of denudation of forests alone contributing to short rainfall was disputed in a recent issue of the *Indian Forester*. Nor was the theory altogether supported by common-sense. The Government replied that it would instruct Deputy Commissioners to use their discretion in the matter, and remove restrictions wherever they saw no objection to this being done.

THE MALARIA-BEARING MOSQUITO.

The letter from Dr. Ronald Ross on the subject of the malaria-bearing mosquito, although it merely confirms the previously received report of his success in finding this insect at Sierra Leone, and does not carry the matter much further than was done by the first announcement, nevertheless affords a convenient opportunity for summarising the results of what promises to take rank among the most valuable scientific discoveries of the century. It is common knowledge that certain districts have for many years been rendered practically uninhabitable by Europeans on account of the prevalence of intermittent fever among those who attempted to settle in them; and that this statement, which applied even to some parts of Italy, applied still more forcibly to certain tropical countries, in which the fevers, essentially of the same character, were of a more malignant and fatal type. Such fevers were attributed in Italy to unknown but unwholesome conditions of the atmosphere, and hence came to be called "malarious," but as to the nature of "malaria" even conjecture itself was at fault. Minute and careful observation of the facts connected with the prevalence of fever led to certain conclusions with regard to its unknown cause; as, for example, that this cause was most active in marshy or recently-drained localities, after disturbances of earth which had long been suffered to remain quiescent, and in lower rather than in higher zones of elevation. It also became known that exposure to the night air of malarious districts was more dangerous than similar exposure in the day-time; and so practical rules were formulated by which settlers could secure, not immunity, but, at all events, some slight increase of protection from the disease. All the malarious fevers, as already said, were intermittent, that is to say, were of the type of "ague." They commenced with a stage of shivering, followed by one of dry heat, and that being succeeded by one of profuse sweating, at the end of which the symptoms became dormant for a time varying with the character of the fever. The most common form was the tertian, in which the successive stages recurred with perfect regularity every third day, but the quartan, in which there was an interval of two clear days, was also well recognised. About the year 1630, the Corregidor of Loxa was cured of an intermittent fever by taking the bark of a tree, presumably made known to him by the natives, and, eight years afterwards, he administered the same bark to the Countess of Chinchon, wife of the Governor of Peru. The tree yielding it hence came to be called cinchona, and the bark, in which its efficacy seemed chiefly to reside, having been introduced into Europe by the Jesuits, was commonly known as Jesuit's bark, and was soon found to be a remedy of the highest value against intermittent fevers of almost every type. In 1810 a Spaniard named Gomez separated from the bark certain active principles to which its efficacy appeared to be due; and in 1820 two French chemists, Pelletier and Caventon, discovered that these active principles consisted of two alkaloids, which they named quinine and cinchonine. Of these, the former was the more active in cases of fever, and soon superseded the bark itself, over which it had the advantages of lesser bulk and of greater activity. Experience showed that the best effects of quinine were obtained when it was administered at a particular period of the attack, and in doses of some magnitude; but it was not found to afford any protection against recurrences of the disease.

Matters remained in this condition until a few years ago. It had been known, from the dawn of microscopic history, that the red colour of blood was due to its holding in suspension an enormous number of minute particles or corpuscles, to which the name of red corpuscles was given; and which, as microscopes improved, were found to be slightly flattened cells containing a red material which is believed to be the chief agent in the carriage of oxygen to the tissues The cells were of circular outline, and of such a size that, laid in a row like coins, edge to edge, about three thousand two hundred of them would occupy a line an inch long. With continued improvement, not only in microscopes, but also in the methods of preparing specimens for examination, it was ascertained that these red corpuscles present differences in different conditions; and it became customary to study their appearances in different forms and at different stages of various diseases. Such examinations, in cases of malarious fever, were chiefly made in Italy, where the disease was more common than elsewhere in Europe; and it was announced by Dr. Laveran that he had discovered certain foreign matters within the red corpuscles of ague patients. The research was eagerly taken up by many investigators, with the general result of establishing a definite connection between the paroxysms and stages of ague and the life history of a parasite, regarded as animal, which attains its maturity within a corpuscle. The parasite is first seen as a small intracorpuscular amœboid body, which enlarges and gradually fills the entire cell, becoming pigmented at the same time, the pigment granules being formed from the contents of the corpuscle. After other changes not necessary to be described, the cell breaks up and perishes, giving exit to a swarm of young parasites, which enter into previously sound corpuscles, and renew the life history of their progenitors. The stages of this life history correspond with the successive stages of fever; the shivering, the heat, the sweating and the interval all occurring at precise periods of the growth and development of each successive brood. The efficacy of quinine has been shown to be due to its destructive action on the parasites, but this action is only strongly exerted when it is present with them in the blood in sufficient quantity, and at a particular stage of their development. The dosage and time of administration, which were originally learned by experiment, have now been made to rest upon definite biological knowledge.

The parasite having been recognised, the next question to be solved was the channel through which it finds access to the blood; and the part known to be played by mosquitoes in the communication of another form of tropical blood disease suggested that they might be the active agents in the matter. It was at once seen that this hypothesis would satisfy a great many known facts of which no adequate explanation had ever been afforded, such, for example, as the boundaries and limitations of the so-called malaria belts; while the nocturnal habits of the mosquito might account for the greater danger of nocturnal than of daylight exposure in the affected regions. The first experiments with mosquitoes, made in Italy, were inconclusive; but, after many dissections, the parasite was at last found in the body of a species known as *Anopheles*, and a man who consented to be made the subject of experiment was shut up in a room with four or five of these insects, was bitten by them, and developed ague in due time. Mosquitoes, entomologically, are only gnats, or *Culicidæ*, of which there are about 150 known species, *Anopheles* being one genus out of several; and the particular *Anopheles*, which has been proved guilty of fever-carrying, is a large variety, distinguished by having four spots on its wings. So far, at least, no conviction has been obtained against any other member of the gnat family, but it would be somewhat hazardous to extend to them the principles of English jurisprudence, and to regard them as innocent until they have been proved guilty. For the common English gnat, *Culex pipiens*, there is probably sufficient exculpatory evidence of a negative kind, but it is clear that, in malarious regions, all blood-sucking insects must be at least suspected. Nevertheless, it must be borne in mind that the enquiry, so far, has reached only an early stage, and that not only may there be tropical fevers, which are not due to the ague parasite, but there may be also harmless gnats in fever-infested districts. The only present certainty is that the distinct tracing of the tertian and quartan forms to mosquito bites will enormously simplify the general problem, even if it should not be found to furnish the entire solution; and perhaps the most encouraging part of Dr. Ross's letter is that in which he expresses his belief that the destruction of the peccant insects, in the puddles in which they spend their larval stage, can be effected without excessive difficulty, and, in large measure, by an agent so little dangerous as kerosine. If this expectation should be realised, the effect will be to open up immense regions of Africa and other countries to European colonisation, and to take away one of the great scourges of the world. It seems highly probable that the destructive effects of the tsetse fly on horses may be due to some similar parasite conveyed by bites, and that the infinitely little, as in so many other recent instances, will be found to play a most important part in relation to the history and destinies of mankind.—*Times*.

LONDON CHARGES OF TEA COMPANIES.

II.

In this article we propose to deal exclusively with the warehouse and dock charges upon tea, about which there is so much complaint, and to start with cannot do better than quote the schedule of rates supposed to apply to every package of tea that goes through the Tea Clearing House. This is as follow:—

CHARGES ON TEA.

To apply to all parcels by ships reporting on and after July 1, 1888.

	Per package, weighing gross.		
	130 lbs. to 159 lbs.	90 lbs. to 129 lbs.	80 lbs. to 89 lbs.
	s. d.	s. d.	s. d.
Landing and housing rate	1 10	1 6	1 4
Management rate	2 3	1 10	1 8
Bulking and taring	1 8	1 5	1 3
Bulking, taring, or weighing net separately	1 3	1 0	0 11
Rent per week	0 0¾	0 0½	0 0½

The above charges will be subject to a discount of 10 per cent. to importers only.

For determining the class under which the break is chargeable, the average gross weight must be ascertained. When the fraction of the average weight is half a pound or more, the dock companies or warehouse-keepers take the benefit. Thus, the average of a break being 79½ lbs. gross, the whole break will be rated at 80-89 lbs., but the average being less than 79½ lbs., the whole break will be rated at 60-79 lbs.

For the sake of bringing the table into manageable shape, we have deleted the rates upon certain exceptional sizes which are seldom used by importers. The general size of the packages is from 90 lbs. to 129 lbs., and in all calculations made in these articles we have taken the rates upon these weights as our basis, allowing the usual deduction of 23 lbs. for the weight of the tare. The charges of most importance to the importer are "management rate"—*i.e.*, the working of the tea—"bulking and taring," and "rent." The management rate includes the landing and housing rate, and a large importer has defined the services rendered for this charge in the following terms:—

"Landing, wharfage, conveyance to warehouse, housing, sampling for importer and broker, sorting to marks and descriptions, weighing, examining for damage, laying down for broker's inspection, and attendance on broker, laying out in showroom for public sale, attendance while on show and sampling, adjusting to weights after sale, coopering, nailing down, trucking and piling for delivery, re-weighing and delivering to land conveyance. The rate also includes furnishing warrants and landing accounts."

Although this sounds formidable, an examination will prove that the greater portion of it represents work which is quite superficial. For instance, in "sampling for importer and broker," only one chest in a break is sampled, and when it is considered that a break consists more often of fifty chests than less, it is apparent that this entails no great amount of work. "Sorting to marks and descriptions" is for the convenience of the wharf in delivering. "Weighing" is only weighing the chest gross as it arrives. "Examining for damage, laying down for broker's inspection, and attendance on broker, laying out in showroom for public sale, attendance while on show and sampling," are quite small items in dealing with a large number of chests. "Coopering and nailing down" applies to the sampled chests only, and although the rate includes furnishing the warrants, it does *not* include the warrant stamp (3*d*. per warrant).

"Bulking and taring" are rates that do not apply to every package. Teas are not infrequently bulked on the estate, and when this is done they are very rarely re-bulked. In regard to taring, according to the Customs regulations, a certain number of chests in every break must be tared from the gross weight of the packages, in order to ascertain the amount of duty to be collected. Should there be a variation of more than a couple of pounds in the weight of the chest, nails, and lead—*i.e.*, the tare each chest of the entire break must be tared, involving the heavy charge of 1s. per package throughout. In regard to "rent," all teas are sold on a "three months prompt," and rent is charged for these thirteen weeks, less five weeks, the rent for which is included in the management rate." In most cases buyers take delivery of the tea within two or three weeks of the auction; but, however soon they may do this, the eight weeks' rent charged upon the tea, to make up the three months, has to be paid by the importer.

We have been at pains to explain the actual charges complained of by producers, and will now proceed to point out why they are considered onerous, but before doing so must first draw attention to the fact that the whole of the bonded tea warehouses in London are in a "ring." Treating the London and India Docks Joint Committee as one body, there are nineteen tea warehousing firms in the Tea Clearing House, which Clearing House has a large number of subscribers, including all the principal buyers and brokers in the trade. According to the rules of the Clearing House, "No subscriber shall be entitled to warehouse or deposit tea with, or employ in connection with tea, any dock company or tea warehouse-keeper who is not a member of the Clearing House or to purchase or sample any tea from the warehouse of any non-member." The "ring," therefore, is most complete, for should a dissatisfied body of importers attempt to start a co-operative warehouse of their own, they find that they have the whole of the tea trade banded against them under the rules and regulations of this Clearing House. We shall have more to say about this matter later on.

Returning to the subject of the charges, it is clear, both from internal and external evidence, that they are excessively high as consideration for the services rendered. First we will deal with the internal reasons that lead us to this conclusion. There is a charge, not given in our table, but sometimes required, for "re-showing for public sale" of 1s. 4d. per package, and it this is added to the

'landing and housing rate" of 1s. 6d. per package, we get a combined rate of 2s. 10d. per package for performing exactly the same services as those covered by the "management rate," excepting that each package has to be handled a second time. For this second handling a charge of 1s. per package is thus demanded, which is absurd when the small amount of labour and time involved is taken into account. Then "bulking and taring," if done together, are charged at 1s. 5d. per package, but if done separately the two operations cost 2s. per package. Now the sole difference produced by dividing the operations into two is that each package of tea has to be opened and closed twice instead of once, and for this additional opening and closing of a chest of tea the charge of 7d. is made. Just imagine what wages workmen with all the skill produced by handling thousands of these chests in a year would earn if they were enabled to charge the warehouse-keepers anything like this price for their time and labour!

Secondly, we assume that the warehouse charges are exorbitant, from this external or public reason—there is the keenest competition amongst those engaged in the warehousing business to secure the handling of tea However much warehouse charges in other trades may be cut, it is admitted on all sides that the warehousing of tea is the most profitable. Hence it affords a fine broad margin, and in spite of the most stringent regulations against the "cutting" of rates, or the granting of special privileges to individuals or companies, we believe that a great deal is done by warehouse-keepers in both directions in order to obtain new business. We know for a fact that discounts greatly in excess of the official 10 per cent. have been allowed to certain companies, and this has sometimes been done in a fashion that verges on the dishonourable. However that may be, the questionable habit certainly flings the door open to fraud on the part of managing directors and other officials of tea companies One case in particular is in our recollection. We have carefully altered the figures; but the actual results were proportionately as we state. Let us assume that the company in question handled 20,000 chests of tea in the year, the dock charges would have been nominally £4,392, upon which the fixed 10 cent. discount would have come to £439. As a matter of fact, £1,098 in discount was allowed and the £661, or rather the proportionate actual figure, was *paid over in sovereigns* so as to avoid unpleasant documents in the nature of evidence that the bond of the "ring" had been ignored. The officials of the company that received this extra money were practically told "We don't care what you do with this money, but do not let the fact that this extra discount has been granted leak out." Subsequently, complaint was made that the company's officials, acting in perfect honesty, had put down the true amount paid by the company for dock and warehouse charges, and not the amount allowed by the rules, in its accounts. This led to awkward questions being put to the warehouse-keeper by his brethren as to why the rates worked out so low. What his answer was we do not profess to know.

It follows that abuses of the most serious kind are fostered by this combination to enforce high charges on tea, and an iron-bound "ring," and the practices known to be adopted to dodge its exactions are calculated to cast a slur upon the whole body of gentlemen connected with the trade. So grievous have the complaints become that many of the warehouse-keepers would welcome a reduction in rates, or rather an increase in the discount allowed. We believe that a motion to this effect was proposed to the members of the Tea Clearing House not long ago, but the suggestion was rejected mainly owing to the energetic opposition of the representative of an important warehouse-keeping firm. Yet we are informed on very good authority that this very firm has granted a discount considerably higher than the official 10 per cent. in order to obtain new business or retain some of its old. We, therefore, think that importers are fully justified in asking for a liberal revision of, or an increase in the discount upon, these charges to at least 25 per cent. The business would even then pay very well, and there would not be the sore and angry feeling prevalent that one tea company may be paying the official rate, while another is obtaining a secret and dishonest reduction, or, worse still, that some official may be personally benefiting by corrupt and corrupting discounts to the detriment of the company he represents Energetic action on the part of the tea trade as a whole in regard to this matter is rendered difficult by the very nature of the ownership of tea warehouse; but this is a large matter in itself, and we will deal with that branch of the subject next week.—*Investors' Review.*

BROWN BLIGHT OF TEA.

The *Kew Bulletin* for August contains the following :—

The "blights," which affect tea in Assam, were investigated and described in the *Kew Bulletin* for last year (pp. 105-112). Another and different one has made its appearance in Ceylon, and has been transmitted to Kew for investigation by Mr. J. C. Willis, M. A. F. L. S., Director of the Royal Botanic Gardens.

[CORRESPONDENCE.]

Director, Royal Botanic Gardens, Peradeniya, Ceylon, to Royal Gardens, Kew.

Royal Botanic Gardens, Peradeniya, Ceylon, April 10th, 1899.

Sir,—By parcel post this week I send you a tin containing some specimens of a fungus blight which is causing considerable injury to tea in many of the planting districts of Ceylon. It resembles the "grey blight" of Assam (which is also common here) in its action on the leaf, and I have recommended similar measures for its eradication to those used for that pest. The specimens enclosed show the conidial fructification of the fungus, and I am sending them in the hope that you may be able to give me the name of the fungus to enable me to round off my investigations into its ravages and life history. In the event of your publishing any account of this disease, I have to request that the name of the estate mentioned on the specimens be withheld from publication Notes upon the disease are given below.—I am, &c.,

(Signed) John C. Willis.

The Director, Royal Gardens, Kew.

(*Enclosure.*)

Specimens from Maskeliya district, 4,000 feet above sea level, sent to Kew. Fructifying specimens pinned. Collected 7th April, 1899.

Disease like grey blight in appearance and effect, but characterised by chocolate-brown colour of fully diseased spots on the leaves attacked. Common in the Central Province.

Shows first on upper side of leaf, and soon afterwards on lower also. Appears as yellowish-brown patches, which rapidly spread and darken to a chocolate, or almost black colour, and, as they extend, their central parts dry-up, die, and often fall out if the leaf is roughly shaken. When the leaf is held up to to the light, a yellowish band, 1-3 mim. wide is seen round the infected area, due to the spreading of the mycelium into the still unattacked area of the leaf, which loses its green colour.

Fructifications not often seen; on the accompanying specimens they show, in typical form, as pinkish spots, more or less concentrically grouped. The spores are oval-oblong, unicellular, hyaline. The blight spreads very rapidly, and does much damage. Measures of treatment recommended are the same as for grey blight.

April 10th, 1899.

MR MASSEE'S REPORT.

The specimens were examined by Mr. Massee, the Principal Assistant for Crypotgrams in the Herbarium of the Royal Gardens. He furnished the following report :—

"The fungus proves to be undescribed, and may be known as *Colletotrichum camelliæ*.

"All the many known species of *Colletotrichum* are parasites, and many are destructive to important economic plants.

"Spraying with Bordeaux mixture, or with ammoniacal solution of carbonate of copper has proved effective in checking the spread of other species of *Colletotrichum*, and would probably prove beneficial in the present instance. In spraying plants like the tea, having glabrous leaves, success mainly depends on the fineness of the spray, which should hang like a fog. A coarse spray causes the solution to form drops which roll off the polished surface of the leaves.

"In addition to spraying, all diseased leaves should be collected and burned, as *Colletotrichum* is a form-genus (= the conidial condition of an ascigerous fungus), and if the leaves are allowed to fall and remain on the ground under the trees, the higher form of fruit would form on the decaying leaves and inoculate the new leaves the following season."

May 3rd. 1899. G. M.

MR. MASSEE'S DESCRIPTION.

The following description has now been prepared by Mr. Massee :—

"The fungus present on the leaves proves to be a species of *Colletotrichum*, a genus perhaps too closely allied to *Glæosporium*,

differing only in the presence of a variable number of coloured spines being intermixed with the conidiophores. Numerous species belonging to these genera are known as destructive parasites, attacking more especially leaves and fruit.

"The leaves of the tea plant are probably infected in the first instance by floating spores settling on their upper surface when damp. The discoloured portion of the leaf corresponds to the range of mycelium in the tissues Eventually the central portion of the blotch changes to a dull grey colour, and becomes studded with numerous very minute black spots, which are often arranged in irregular circles. These points correspond to the clusters of spores which rupture the epidermis of the leaf and become free on the surface, whence they are washed by rain or carried by wind to other leaves. After the spores are mature, those portions of the leaf on which they are produced become dry and brittle, and are blown about by wind, and as many spores still adhere to such floating fragments, it is not difficult to understand why the disease spreads so quickly when once established in a plantation."

PREVENTIVE MEASURES.

Ceylon. Central Province. On living leaves of *Camellia thea.*

Bordeaux mixture has been proved to arrest the spread of disease caused by other species of *Colletotrichum*, as *C. lindemuthianum* on scarlet-runners and French beans, *C. altheæ*, on hollyhocks, &c., and would probably prove effective in the present instance. Care should be taken to experiment at first with a very dilute solution until its action on the leaves is ascertained.

Diseased leaves should be picked before the spores are mature; that is, as soon as the first indications of the presence of the fungus are observed. If this practice was universally followed through the infected area, the disease could be readily exterminated.

NITROGENOUS MANURES.

Continuing his remarks in the *Gardeners' Chronicle*, Mr. J. J. Willis of Harpenden, says :—

NITROGEN FOR PARTICULAR CROPS.

The influence of the kind of crop in determining the possible profits from the use of the materials applied affects more particularly the constituent nitrogen. For example, the liberal application of materials containing nitrogen to crops which possess a low market value may result in a maximum production, that is, as large an increase in yield as it is possible to obtain; yet because the nitrogen is so expensive, the value of the inceased yield may not be equal to the cost of the nitrogen applied.

On the other hand, its application to crops of a high market value, though not causing so large a proportionate gain in crop, may result in a larger profit, because the cost of the nitrogen, though considerable, is relatively a small item when compared with the increased value of the crop obtained from its use.

The adjustment of the fertiliser to the kind of crop is not a matter of indifference. In the one class of crops, only a small application can be afforded, while in the other case even an excessive application may be profitably made, if by the excess a maximum crop is obtained

MOST SOLUBLE FORMS OF NITROGEN.

In the next place, the form of nitrogen used is very important, particularly in the culture of early market-garden crops, or such as are improved in quality, and thus increased in value by virtue of quickness of growth Market-garden crops, as turnips, beets, lettuce, tomatos and others, in order to be highly profitable must be grown and harvested early. At this season the natural soil agencies are not active in the change of soil-nitrogen into available forms; and the plants must therefore be supplied artificially with the active forms of nitrogen, if a rapid and continuous growth is to be maintained. Their edible quality is dependent to a marked degree upon this rapidity of development; hence a supply of plant-food in reasonable excess of ordinary demands is essential, in order that unfavourable conditions of season may in part at least, be overcome.

Nitrogen exists in commercial products in a form that is immediately available, namely, nitrates; yet the fact that a nitrate is extremely liable to loss, for the reasons already given, makes it desirable to determine—first, whether this most available form is in actual practice of greater or less service than those other forms which are rapidly changed into this active form, but which before their change are not liable to be lost from the soil. For example, the nitrogen in nitrate of soda is immediately available to the plant; if it is applied before or at the time of seeding in such quantity as to meet the entire demands of the crop, an opportunity is afforded for loss previous to the time that the plant has thrown out its roots and is able to gather it from the soil, and also during its early growth, when it is unable to gather it rapidly. Sulphate of ammonia or dried blood are forms which change very rapidly into the nitrate form, but which previous to that change are readily held by the soil.

In the use of any of these forms of nitrogen, therefore, the conditions which prevail between the time they are applied and the time that they can be used by the plants, would determine their relative usefulness.

LIPTON'S TEA PACKERS.

APPEAL FROM THEIR EMPLOYEES TO THE PUBLIC.

We have received from Mr. T. Chambers, General Secretary of the Workers' Union, 181, Queen Victoria-street, E.C., a statement relative to the conditions now prevailing at the tea-packing warehouse of Messrs. Lipton, Limited, London. The men are asking for better treatment, which has been refused, consequently they wish to place their case before the public before resorting to extreme action.

There are about 1,300 men, women, and girls employed at the warehouses in the City-road, who may be classed as unskilled workers. The average number of hours worked per week is fifty-five, the wages for the men employed in the tea department, coopers, porters, mixers, blenders, &c., varying from £1 to £1 2s. per week. The wages of the girls average about 7s per week. In the cacao and chocolate department the wages of the men vary from 15s. to 24s. per week. The general conditions are most harsh, a prepetual superveilance and petty tyranny prevailing.

When the men first began to organise there were a large number of them who were in receipt of the small sum of 18s. for fifty-five hours' work, and at the present time there are some six men, ages varying from twenty to forty years, employed in the cooper's department at marking, scraping, and carrying the tea chests downstairs and distributing them to the girls, to pack, for which they receive the varying amounts of 13s. to 18s. per week as wages.—*Daily Chronicle*, September 18th.

STRAY NOTES ON MANURES.

Grass Manures.—Sir John Bennett Lawes and Sir J. H. Gilbert's famous experiments at Rothamsted, demonstrate that while nitrogenous manures, such as ammonium salts and nitrate of soda, are most beneficial to grasses, potash and phosphoric acid produce the most profitable crops of leguminous plants. Further, if farm-yard manure can be liberally used for grasses it will not, as a rule, be necessary to apply potash artificially; but phosphates may advantageously be used as basic slag and nitrogenous manure in the form of nitrate of soda, which, however, should seldom be used at the rate of more than 1 cwt., or at the most, 1½ cwt. per acre. As a result of their experiments they state that one of the very best artificial manures which could be applied to pasture land is 1 cwt saltpetre mixed with 3 cwt. of basic slag per acre. At Rothamsted 500 lbs. potassium sulphates, 100 lbs. sodium and magnesium sulphates, 3½ cwt. superphosphates, 400 lbs. ammonia salts, and 2,000 lbs. cut wheat straw have been used yearly on meadow land, which has been laid down as pasture for over 100 years and on which no fresh seed has been sown for upwards of forty years. Under these conditions, this mixed manure produced 51¼ cwt. of hay per acre at the first cutting during the twenty-fifth year of using artificial manures, while pasture land that had during the same period remained unmanured gave a yield of only about 9½ cwt. per acre. It ought to be unnecessary to point out that a pasture cannot be expected to continue productive unless some return is made to it to compensate for the continual drain caused by the production of meat, milk, &c., but the truth of this obvious fact is not yet recognised as it should be by every farmer. Every 10 gallons of milk contains nearly ½ lb phosphate of lime, so that a cow giving 17 quarts per diem removes 1½ lb per week, or the equivalent of 1½ cwt. bone meal per annum, while every 100 lbs. of cheese contains 1½ lb. of phosphate of lime

which is equal to about 5 lbs. of bone meal. An impression prevails that the use of artificial manure on pasture land is exhausting both to the land and the plants; but this is so only when one fertiliser, such as nitrate of soda, is used to excess, without corresponding proportions of phosphates, potash and lime.

A simple Way to tell if Soil needs Lime.—The following methods have been taken from Bulletin No. 59 of the New Hampshire College Experiment Station by our trans-Atlantic contemporary *Gardening*, and are so simple and inexpensive that they can readily be used by every gardener in testing his compost heap and potting soil: "A tablespoonful or more of soil is placed in a tumbler or cup, and moistened with sufficient water to make the mass of about the consistency of a thick paste. It is best to allow it to stand for from fifteen to twenty minutes before making the test, though it may be made at once. With a knife-blade part the soil, and introduce one end of a slip of blue litmus paper (a few pence will buy enough to make many tests), which may conveniently be one-half to three-quarters of an inch wide and 2 inches long; press the soil about the paper, and after from two to five minutes remove the paper without tearing it; rinse off the adhering soil with water, and note whether it still retains a blue tint or has become positively red. If the paper has been strongly reddened, it may be concluded that lime will probably benefit many crops which may be grown upon the soil. If the soil has a marked reddish tint, as is sometimes the case, it may be better to bring out one side of the paper in contact with it; and if a red colour comes through to the other side it may be concluded that the soil is acid. In all cases care must be taken not to handle the end of the paper which is used for making the test, since the touch of the fingers may redden it, and thus one might be deceived. By another method a teaspoonful of soil is stirred into a glass of water to which a few drops of ammonia have been added, and the whole set aside for some hours; the liquid which remains at the top will be nearly colourless, but where lime and magnesia are lacking in a soil the liquid has usually a dark brown or black appearance, the intensity of colour depending upon the amount of soil taken, and of course upon its need of lime." Wood ashes contain a large amount of lime in a very available shape, as well as other valuable fertilizer ingredients. When they are not at hand air-slaked lime can be used. It must be remembered that lime mixed with manure, bone, or any substance containing ammonia will set the ammonia free to pass off in the air and be wasted. In using lime or wood ashes they should be mixed with the soil before the other fertilizers are added, and the soil allowed to stand for some time.

Manure for Indoor Plants.—(1) Sodium chloride, 10; potassium nitrate, 5; magnesium sulphate, 5; magnesia, 1; sodium phosphate, 2; mixed and bottled. Dissolve a teaspoonful daily in a litre of water, and water the plants with the solution. (2) Ammonium nitrate, 40; potassium nitrate, 90; ammonium phosphate, 50; 2 gm. is sufficient for a medium-sized flower-pot. (3) Ammonium sulphate, 10; sodium chloride, 10; potassium nitrate, 5; magnesium sulphate, 5; magnesium carbonate, 1; sodium phosphate, 20. A teaspoonful to a litre of water. (4) Ammonium nitrate, 40; ammonium phosphate, 20; potassium nitrate, 25; ammonium chloride, 5; calcium sulphate, 6; ferrous sulphate, 4. Dissolve 2 gm. in a litre of water, and water the plants with the solution. (5) Potassium nitrate, 20; potassium phosphate, 25; ammonium sulphate, 10; and ammonium nitrate, 35. This mixture produces a luxuriant foliage. If blooms are desired, dispense with the ammonium nitrate.

Fertilizers improve the Quality of the Crop.—Even in the fertile portions of the west (America), where soil enrichment is scarcely necessary, the quality of the crop can usually be improved by an application of fertilizer even if the yield of fodder or ear corn is not increased. Whether or not this is sufficient to warrant an application of the material, each farmer must determine for himself.

Home-made Fertilizers the Cheapest.—The Ohio experiment station concludes that, so far as a single season's work can show, there is no superiority of the factory mixed over the home mixed of equivalent composition and that the cost of the fertilizer is greatly reduced by home mixing.

Cheap Manuring.—An experienced planter writes to the *Times of Ceylon* as follows:—

"I am not very much taken with Mr Bamber's cheap manuring. Practical planters can't get much nitrogen at Rs.9 per unit, for Rs.28 per acre, and where, oh! where, is the potash and phosphoric acid? It takes a lot of careful forking to match a good hole 2 ft. × 1½ ft. × 9 inches well filled with well-mixed manure at Rs 120 per ton—5 cwt. per acre—a hole to each tree. But, who is going to do this under Rs.10—or for Rs.10—for holing and application—to which add Rs.30 cost of manure? And, think you that this 2½ ounces of manure per tree is going to replace the wastage due to a crop of 500 to 600 lbs. of tea per acre over four years? Go to! Of course, it is quite possible to reach each tree by forking every second line only, and, to do this for under Rs.5 per acre,—but even then you can't evade the cost of the manure—while, of all the works that a cooly can scamp, forking is the one most difficult to supervise. On badly-lined estates also it would be impossible to take the missed-out lines at the next manuring. Even on well-lined estates after three years with an intermediate change of superintendents, who is going to pick up the lines that were not forked at the previous application? No! on good flat land (of which few up-country estates have 25 per cent.) forking under supervision is all right—elsewhere holing is safest, except on very steep land, where it is best to dibble manure in with an *alavangu*—and very cheap work of all kinds is very nasty work, as a rule; and from all cheap manures—deliver us!"

TO INCREASE THE ADHERENCE OF FUNGICIDES.

Notes on investigations on means for increasing adherence of fungicides, by J. Perraud (in the Comptes Rendues of the Academi Scientifique of Paris, state that in order to ascertain the degree of adherence of a number of fungicides, the author conducted a series of experiments with a solution of 2 per cent. copper sulphate rendered slightly alkaline with fat lime, 2 per cent. copper sulphate and 2 per cent. fat lime, 2 per cent. copper sulphate rendered slightly alkaline with sodium carbonate and neutral copper acetate To these different solutions a number of substances were added to render them more adherent.. Among those used were dried blood, the white of egg, gum tragacanth, glue, soap, and resin. Eau celeste was also tested. After spraying these upon grape leaves and fruits and allowing them to dry for two hours in the sun both the fruit and leaves were subjected to an artificial rain amounting to 4 mm. and the percentage of copper adhering to them determined. The results show that all the modern fungicides are less adherent to the fruit of the grape than to the leaves. From the standpoint of their adherence the fungicides tested are reported in the following order: (1) The solution of copper sulphate made slightly alkaline with carbonate of soda; (2) the copper sulphate made slightly alkaline with fat lime; (3) the solution in which equal quantities of copper and lime were used; (4) neutral copper acetate; (5) eau celeste, and (6) copper sulphate and slaked lime.

Of the substances used to increase the adherence of the fungicides, resin was by far the best, followed by soap, potassium silicate, molasses, gum tragacanth, and glue. The other substances employed either were without apparent effect or seemed to diminish the adherence of the fungicides. It is ascertained that the nature of the lime which enters the preparation of Bordeaux mixture is of great importance. Quicklime only should be used, and it should be slaked at the time of using. On account of the remarkable adherence of resin mixtures, especially on the fruit, the author proposes continuing investigations with fungicides containing this substance.

THE KOLA NUT.

In an article in his book on Hausaland, Mr. C. H. Robinson states that kola nuts are in everyday use throughout the Hausa States, though the tree, *Sterculia acuminata*, is not indigenous. The habitat, he says, is in the country at the back of the Gold Coast Colony, and it is also found near the river Gambia. He describes the fruit as resembling large-sized chestnuts, encased in long pods, each containing four or six nuts. The pods grow in bunches of three or four together. The colour of the nuts is generally brick red, though it varies somewhat, especially in the Far West, where the colour ranges in all shades between red and white. Amongst the Bambara tribe, kola nuts are used as tokens, each colour having a special meaning; thus a white kola is a sign of friendship and goodwill, whilst declarations of war, proposals of marriage, &c., are conveyed by transmitting a number of nuts of certain colours. The best kola nuts come from Gandja, and they are of a uniformly red colour. These find their way

to Kavo, the capital of the Central Soudan. The merchant is obliged to exercise the greatest care and attention, so that the nuts may reach the market in a saleable condition. In order to do this, they have to be kept in a constantly damp condition, for, should they be exposed to the air and allowed to dry, they become as hard as wood and lose 90 per cent. of their value. The method of preservation adopted is packing the nuts in baskets, and covering them with fresh green leaves. Every four or five days they should be re-packed, and those which have become mildewed are removed The substantial profit, however, made on those which reach the market in good condition more than compensates the merchant for the amount of trouble taken. It is interesting to note that the natives, both rich and poor, have for generations sought after kola nuts, and are willing to spend their last piece of money in obtaining one. They say that a nut keeps off the pangs of hunger, and enables them to work for long periods without food. The whole of the trade is at present in the hands of the natives, and Mr. Robinson relates that on one occasion he met a caravan consisting of about 1,000 men, together with a large number of donkeys carrying kola nuts towards Kavo. The value of the nuts in the caravan, which was only one out of the several which annually proceed to Kavo, was little less than £100,000 sterling —*B. & C Druggist.*

TEA, ETC., COMPANIES.

Kyntyre Tea Estates.—The Kyntyre Tea Estates Company, Ld., has made a profit of £5,770; and the directors recommend an ordinary dividend of 8 per cent., besides placing £500 to depreciation account, and carrying £121 forward.

Scottish Trust and Loan Co.—The Scottish Trust and Loan Company of Ceylon, Ld., is paying 5 per cent. for the year, and 5 per cent. bonus, placing £1,000 to reserve, and carrying forward £1,565

The Ottery Tea Company of Ceylon, Ld.—The report of the Directors says:—The crop secured was 141,555 lbs., against an estimate of 160,000 lbs., the shortage being due, in great measure, to unfavourable weather. After deducting R1,000 from reserve account, as arranged last year, to pay for part of the amount spent on manure, viz., R2,827 60, the tea has cost, laid down in Colombo, cts. 27·31 per lb., or, without manure, cts. 26·02 as against cts. 25·05 last year. The net average price realised was cts. 46·91 as against cts. 42·40 last season, which may be considered very satisfactory. After making provision for the interest on mortgage, &c., the balance of profit available amounts to R24,466·52. Of this amount R8,940 was absorbed by the payment of an *interim* divided of 3 per cent. to 31st March last, and the directors now recommend that a final dividend of 5 per cent. be paid, absorbing R14,900, that a bonus of R500 be paid to the Superintendent, and that the balance of R126·56 be carried forward to the next account.

Hornsey Tea Estates Company (Ceylon).—The Hornsey Tea Estates Company, Ld, is to pay the usual 6 per cent. on its Preference shares, and 2 per cent. on its Ordinary shares, besides writing off £310 for preliminary expenses, and carrying forward £11.

The Carolina Tea Company.—The Carolina Tea Company of Ceylon, Ld., pays 7 per cent. on the Ordinary shares; places £1,200 to Reserve, and carries forward £1,199.

GUTTA AND RUBBER IN BRITISH NORTH BORNEO.

The following report by Mr. Henry Walker, Commissioner of Lands, is taken from the *British North Borneo Herald*:—

Borneo Guttas and Rubbers are quoted in the price currents of the world and are well known to trade. They have been collected and are still being collected by Dyaks in the vast jungles of British North Borneo. There are many qualities of gutta, the price of which varies from $30 to $380 a picul, say, 5½d. to 5s. 9d. a lb. Of rubbers there are several kinds, but the price is more constant, say, about $60 to $80 a picul or 10d. to 1s. 2d. a lb. The railway to the interior, now constructed as far as Beaufort on the Padas river, promises to increase the export of gutta from the West Coast of British North Borneo as parties of Dyaks are already making their way up to the interior by the route in larger numbers than hitherto. In 1896 one Dyak Chief Nakoda Ball came down the Penga Gorge road with some Muruts from the far interior of North Borneo and sold his collection of gutta for $3,600 (that was the first time that any of the interior tribesmen had seen the sea), but the collections likely to be made by Dyaks in the near future will probably beat that record. The Dyak collector only fells gutta trees over six inches in diameter, because, as he says, trees of a smaller size have too thin a bark to yield any gutta. Consequently the gutta collector does not exterminate—he merely collects a ripe crop and leaves nature to furnish a further supply in years to come. In this respect he differs from the gutta leaf collector who fells every tree, small or great: and, if leaf collecting is allowed, extermination must ensue—or so few trees will be overlooked that future collection will not pay. Another point against the leaf collection is the weight of the leaf, if not dry—the trouble of drying it—and when dry the small percentage of gutta extracted.

Having felled a gutta tree, the collector rings the trunk at intervals of about seventeen inches—cutting through the bark to the wood—and, if available, places a piece of bamboo below each cut to receive the juice and keep it clean. A great deal of the variation in price is due to bad treatment and to adulteration with leaves, twigs and soil. There are many trees in British North Borneo yielding gutta, but I am not yet able to give any but native names. At Tenom at the junction of the Pagalan and Padas rivers, which is to be the terminus of the present railway, a fair is now held every fifty days and is attended by traders who carry up salt, cloth, matches and luxuries, such as Rimmel's scents in superior bottles! and bring down gutta, rubber, dammar, rattans, bees-wax, skins, &c. At Tenom there are seven kinds of gutta with the following native names:—

Ilang, two kinds, red and white, price $100 a picul. At Kaningow, thirty miles higher up the Pagalan, this is better prepared and fetches $120.

Gutta Durian, red, $100.	Merrisa, $60.
Gutta Tagal, $80.	Menown, $30 to $40.
Bajoorye, $80.	

Of rubber two kinds are brought to the fair:—Kubal at $60 and Menungun or Gutta Lichak at $80.

The Menungun rubber creeper is cultivated by the natives dwelling on the Telicosan river, a very large stream—so large indeed that at times it causes a flood on the Padas. There are several large villages with long houses well raised above the ground containing sixty doors, *i.e.*, families. Some of the people have plots planted with the Menungun creeper which they tap after about the seventh year and only retap when the last wound has healed, which probably means once a year. I am told that this creeper attains a diameter of twenty inches. I have seen it fully six inches thick on the Segama River and it is known all through North Borneo by the same name. The fruit resembles a very large orange and is sweetly acid—a most delicious fruit to eat. So far as I know it ripens in October. It should be grown together with rotan, which assists the creeper in climbing upwards.

All the above guttas and rubbers grow in the Tenom district, where the Government is now opening an experimental garden under the charge of Mr. Chas. Keasberry. That gentleman informs me that he can get all the labour he requires and frequently has to refuse work to parties of natives from the Upper Padas. A large block of Tobacco land was marked out on the Upper Padas by the Borneo Tobacco Syndicate and since then the natives are constantly enquiring when the estate will be opened. From what I can gather I should say that several thousand coolies can be obtained from the Upper Padas when required for planting purposes. The women work as well as the men. Until the railway is opened to Tenom the bridle-path on the right bank of the Padas must be availed of. When I used the road in July it was in good order and I could have ridden a pony along it, except for one small landslip at Rayoh and one fallen tree. Mr Tower, the Railway Engineer, who was with me, remarked that it was as good a bridle path as the hill roads of Ceylon. The telegraph wire runs along this path which can be kept in order by the telegraph coolies at a small additional expenditure.

At present a party of Dyaks are seeking gutta on the Lower Padas district which contains gutta trees in large quantities—a very reassuring fact to the planter who may think of taking upland along the railway line. An application has just been made by the Eastern Extension Telegraph Co. for a huge block of land

between Bukow and Beaufort, along the railway line, for rubber and gutta planting.

At Kaningow on the Pagalan the great southern tributary of the Padas, a better class of gutta is brought called Kayan, a red gutta, which sells for $200 at Kimanis. It is of a superior quality, unbreakable when bent and comes from Menown on the south-east of Kaningow in the Dalit country. This wealth of natural indigenous gutta extends across the territory to Sandakan, but at Sandakan a more valuable class of gutta is obtainable. The local name is Klapeii, a large and a small leaf, red underneath, growing on low hills, the gutta from which sells for $140 to $380 a picul, say (at exchange 2/-), equal to 2/1 to 5/9 per lb.

I met parties of Dyaks on the Segama in 1885, who had been about 250 miles up that river gutta-collecting, but the Kinabatangan and its great tributaries, which extend beyond the centre of our territory up to the Eastern slopes of the West Coast hills, afford the largest gutta-collecting ground. The amounts collected must vary considerably, but, as far as I can learn, the gutta collectors earn about 9 or 10 dollars a month after paying their expenses. Their expenses are not great; a little rice, a little (a very little) clothing, matches, salt and tobacco, all of which they obtain on credit from a trader, who, of course, expects to buy the gutta on their return. He has to pay the current price and the Dyaks are quite able to take care of themselves in that respect. When in the jungle the Dyaks maintain themselves by fishing, snaring and hunting, in which they are assisted by their dogs. On the whole, the gutta collector's life is a hard one—small profit and much loss of life—but their traditions and customs lead them into the jungle, where they can indulge their taste for a wild, savage life to the fullest extent, except as regards head hunting which has been put down with so stern a hand by the European that the venturesome Dyak now only rarely takes a head

Large collections of gutta are made on the head waters of the Padas by the local natives, but these chiefly go to the independent territories and into Dutch Borneo and are sold to traders who supply repeating rifles and guns of sorts, the importation of which is not allowed in British North Borneo.

The exports of Gutta and Rubber from British North Borneo for the years 1897 and 1898 were as follows:—

	1897.	1898.
Gutta	$93,639	$125,280
India Rubber	$49,513	$ 79,600

STATISTICS RELATIVE TO TEA.

II.

We will now consider, in the first place, the figures for the first quarter of the present London market (new season), 1899-1900, *i.e.*, the figures from the 1st June to the 31st August 1899. The figures in all cases are those of the *Tea Brokers' Association*. We mention this because the figures furnished by the "Customs" and "Board of Trade" do not exactly correspond, differing, in fact, in some cases very considerably. So also, in a measure, with the figures contained in the different reports of the London tea brokers, who, with the exception of Messrs. Gow, Wilson and Stanton, generally give round numbers instead of the exact figures.

STATISTICS OF INDIAN AND CEYLON TEA.

(i).—1st June to 31st August 1899.

IMPORTS.

	1899. Lbs.	1898. Lbs.	Difference. Lbs
Indian	25,730,707	20,848,825	+4,881,882
Ceylon	29,143,330	28,503,886	+ 639,444
Total ...	54,874,037	49,352,711	+5,521,326

DELIVERIES.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Indian	28,757,895	30,716,996	−1,959,101
Ceylon	24,560,576	23,965,282	+ 595,294
Total ...	53,318,471	54,682,278	−1,363,807

The increase in the imports of Indian tea over that of 1898 was thus 4,881,882 lbs., whilst there was concurrently a decrease in the deliveries of 1,959,101 lbs. The decrease is solely Indian, Ceylon deliveries showing a steady increase.

(ii).—1st to 31st August 1899.

IMPORTS

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Indian	13,472,938	13,350,924	+122,014
Ceylon	9,413,876	9,301,936	+111,940
Total ...	22,886,814	22,652,860	+233,954

DELIVERIES.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Indian	10,015,542	10,377,965	− 362,423
Ceylon	8,633,180	8,385,722	+247,458
Total ...	18,648,722	18,763,687	−114,965

The increase in the imports of Indian tea over that of 1898 was thus 122,014 lbs., whilst there was concurrently a decrease in the deliveries of 362,423 lbs. The decrease is solely Indian, Ceylon showing a steady increase. Thus, for the first quarter of the present London season and the month of August last, the deliveries of Indian tea show a marked decrease when compared with the previous year We will now see how the stocks of all kinds of tea stood in London on the 31st August 1899:—

STOCKS OF ALL TEA ON 31ST AUGUST 1899.

	1899. Lbs	1898. Lbs.	Difference. Lbs.
Indian	28,474,353	28,205,617	+ 268,736
Ceylon	24,373,006	21,531,898	+2,841,108
China, &c.	18,093,689	16,077,958	+2,015,731
	* 70,941,048	† 65,815,473	+5,125,575

* Arrived to 31st August, but not yet included in above stock *Nil.*
† „ „ „ „ „ about 600,000 lbs. Ceylon.

Indian tea thus shows an increase in stock held of 268,736 lbs. only, over that held on the corresponding date last year, whilst the increase in stock of Ceylon tea is 2,841,108 lbs, and China (including Java, Japan, &c.) tea, 2,015,731 lbs.

The Tea Brokers' Association figures for September 1899 have not as yet come to hand, but the following approximate figures relative to Indian tea were wired out on the 2nd instant. We give the figures for 1898 also for the purpose of comparison.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Imports	19,400,000	19,208 167	+191,833
Deliveries	12,300,000	11,354,452	+945,548
Stock ...	35,574,000	36,059,332	−485,332

These figures, although only approximate, are encouraging, showing that the tide for Indian tea has turned, and that taken at the ebb (as has been done), Indian tea will now lead on to fortune. The month of September has proved the turning-point for good, as the following figures will show:—

STOCK—INDIAN TEA.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
April	40,767,884	49,457,815	−8,689,931
May	31,501,541	38,213,368	−6,711,827
June ...	25,886,498	29,133,669	−3,247.171
July	25,016 957	25,232.658	− 215,701
August	28,474,353	28.205,617	+ 268,736
September	35,574,000	36,059,332	− 485,332

These figures show that at the commencement the of season the stock of Indian tea was depleted to the extent of over 8½ million pounds compared with 1898. Owing to heavy exports from Calcutta, however, the stock increased, month by month, until, in August last, the stock held exceeded that held during the corresponding period in 1898 by 268,736 lbs. September figures, however, show again a depletion in stock, and present conditions all point to a continuation of such. We think it probable that there will now be, month by month, a greater depletion of stock, thus placing the industry in this country once again on its legs.

DELIVERIES OF ALL TEA
1st January to 31st August 1899.

HOME CONSUMPTION.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Indian .. .	85,299,773	83,597,000	+1,702,773
Ceylon	51,778,479	54,431,022	−2,652,543
China, &c.	14,239,203	12,177,282	+2,061,921
Total ...	151,317,455	150,205,304	+1,112,151

The average delivery per month this year (January to August, of tea for home consumption has thus been for Indian, 10,662,472 lbs; for Ceylon, 6,472,310 lbs.; for China, 1,779,900 lbs.; for all tea (total). 18,914,682 lbs.

EXPORTED.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Indian	4,213,753	4,319,045	− 105,292
Ceylon	7,553,903	7,644,380	− 90,477
China, &c.	7,974,032	11,458,497	−3,484,465
Total ..	19,741,688	23,421,022	−3,680,234

TOTAL DELIVERIES.

	1899. Lbs.	1898. Lbs.	Difference. Lbs.
Indian	89,513,526	87,916,045	+1,597,481
Ceylon	59,332,382	62,075,402	−2,743,020
China, &c. ...	22,213,235	23,635,779	−1,422,544
Total ...	171,059,143	173,627,226	−2,568,083

Strange to say that, whilst the home consumption of Indian tea has increased by 1,702,773 lbs., as against the corresponding period in 1898, China tea has concurrently increased by 2,061,921 lbs., and Ceylon tea decreased by no less an amount than 2,652,543 lbs. It is evident that the consumption of China tea at home is not quite so moribund as is popularly believed. The exports of China tea from London have, however, fallen off to the tune of 3,484,465 lbs.—a very considerable amount—whilst the total deliveries of Indian tea have increased by 1,597,481 lbs. over the corresponding period during 1898. Ceylon tea has concurrently fallen-off by no less an amount than 2,743,020 lbs. and China tea by 1,422,544 lbs. Ceylon's great aim is evidently to supply foreign markets more and more, shipping to them direct from Colombo. The experts of Indian tea from London are also visibly growing less, whilst the home consumption is increasing. All things point to India following in the wake of Ceylon and shipping direct to foreign ports. If the demand for outside markets continues to increase in the ratio that it is doing at present, in a few years' time we may, like Ceylon, find it more advantageous to pay greater attention to foreign markets rather than the home market. In such case the "rings' at home will feel rather small when they find the United Kingdom allotments, but a fraction of the large supplies shipped to other marts direct. According to Messrs. W. S. Cresswell & Co.'s last tea report, dated the 6th instant, whilst only 10 per cent. more tea has been shipped to Great Britain this season than the corresponding period last season, there has been shipped to Australia 71¼ per cent. more; to America 170½ per cent. more; and 5⅞ per cent. more to sundry ports. Up to the 6th October, 41 per cent. of the teas sold in Calcutta this season have been purchased for foreign ports against 32½ per cent. during the corresponding period last year. "Coming events cast their shadows before," and unless we are much mistaken, before a few years more pass over our heads, the percentage taken by foreign markets will be very largely increased.

We have now given all the most recent figures illustrating the present statistical position of tea, especially Indian tea, so far as they relate to the trade with the United Kingdom; or, in other words, with the London market. A number of deductions can be drawn from the gures presented, to which we have not alluded for want of space.

Before concluding we will give a few statistics relative to the sales held in Calcutta, which we take from Messrs. Watson, Sibthorp and Co.'s report, dated the 12th instant. Since the season opened on the 12th May last, nineteen series of sales have been held, at which 333,466 packages sold at an average of 6 as. 1 p., or nearly 8d. per lb., as compared with 340,430 packages sold in twenty-two sales before the Pujahs last year at 5 as. 9 p., or about 7½d. per lb., and 278,950 packages sold in seventeen sales in 1897 at 6 as. 8 p. or about 8d. per lb.

Season.	Number of packages.	Average per lb. A. P. d.	Exchange. s. d.	Number of sales.
1899-1900	333,466	6 1 or 8	1 $4\frac{5}{16}$	19
1898-99	340,430	5 9 „ $7\frac{1}{4}$	1 $4\frac{1}{2}$	22
1897-98	278,950	6 8 „ 8	1 $3\frac{1}{2}$	17

The average exchange for six months' documents has been 1s. $4\frac{5}{16}$d, and the average freight £1 19 3 per ton of 50 cubic feet.

The following are the total quantities from each district since the season opened together with the averages realized:—

Districts.	Packages.	Average per lb. A. P.	d.
Assam	60,908	6 10	or 8½
Cachar	73,792	5 8	about 7¼
Sylhet	58,645	5 4	„ 7
Darjeeling	31,439	7 10	„ 9¾
Terai	27,903	5 4	„ 7
Dooars	69,640	5 11	„ 7½
Chittagong	5,813	5 10	„ 7⅜
Kangra Valley	1,486	5 4	„ 7

According to Messrs. W. S. Cresswell & Co.'s tea report, dated the 6th instant, the quantity of tea sold in Calcutta from 12th May to 6th October 1899 was 27,673,800 lbs., as against 25,841,500 lbs. during the corresponding period last year.

According to Messrs Watson, Sibthorp & Co's report, dated the 12th instant, the exports from 1st April to 9th October 1899 from Calcutta to Great Britain were 83,33 ,981 lbs., as compared with 75,123,728 lbs., at the corresponding period last season and 73,619,240 lbs. in 1897.

In conclusion, as it is important to know details of the shipments from Calcutta, we give the following statistics:—

EXPORTS FROM CALCUTTA.

	1899. Lbs.	1898. Lbs.	1897. Lbs.
To London—			
From 1st Jan. to 31st March ...	13,144,800	12,850,539	14,142,139
„ 1st April to 31st Aug. ...	52,461,655	47,904,396	48,052,802
In September... ...	23,522,893	21,935,364	20,883,935
Total for nine months ...	89,129,348	82,690,299	83,078,876
To Australia and New Zealand—			
From 1st Jan. to 30th Sept. ..	5,557,535	3,782,866	4,265,078
To America—			
From 1st Jan. to 30th Sept. ...	1,912,117	1,127,957	783,935
To all other places—			
From 1st Jan. to 30th Sept. ...	4,406,321	5,202,879	3,069,733
Grand Total for nine months ...	101,005,321	92,804,001	91,197,622
Total for six months from 1st April to 30th Sept. ...	87,860,521	79,953,462	77,055,483

The above figures include all teas for which Custom House passes have been granted (less relands, &c.)

TEA-SELLING DEVICES.

The following is a copy of a handbill circulated in a certain part of the U. K. :—

Something for a Rainy Day!—From 7*l.* to 30*l.* for every wife who becomes a widow. Every married woman, every married man should read this circular. It tells of Cobden's great scheme, and shows how you may secure an interest in it. Easy! Safe! Certain! Everybody sees the necessity of making a provision for the future, and yet how difficult it is, out of small income, to make the provision which all see to be desirable. The Cobden Tea Company (Limited) have solved this great problem. They know full well the strain that is thrown on the bereaved widow when the bread-winner is taken away, and it is the determination of the company to come to the help of the consumers of their tea in this time of special need. How is this to be done? By the payment to the widow of a substantial sum in hard-cash immediately after the decease of her husband—a sum large enough to help her to look into the future with some degree of hope and comfort. This great scheme has been put on a sound financial basis, and is being welcomed by all sections and classes, inasmuch as it secures to all widows, at no extra cost to themselves, and with no trouble whatever, a nice sum of money just when it is most needed. Commence using Cobden tea, and like thousands all over the country secure for yourselves a sure and certain provision for the future. Remember—Cobden tea is sold at a price within the reach of all, viz., 2s. per lb. Owing to its immense strength and fine quality, it will go twice as far as many ordinary teas, and is therefore cheaper. The Cobden Tea Company, Limited (incorporated under the Companies Acts, 1862 to 1898), will pay to every woman who becomes a widow the following sums of money:—If, at the commencement of taking Cobden tea, the husband is under thirty years of age, 30*l.*; forty, 25*l.*; fifty, 18*l.*; sixty, 12*l*; seventy, 7*l.*, provided she has purchased a half-pound of Cobden tea for the five consecutive weeks prior to her becoming a widow. Customers who purchase a quarter-pound of tea weekly will receive half the above sums. In the interest of *bonâ-fide* customers the company require that the husband shall be proved to be in good health at the commencement of the continuous taking of the tea. Quarter benefit in five weeks, half benefit in six months, full benefit in twelve months. Lists of moneys paid, with the names and addresses of the widows who have received the benefit, can be seen at the registered offices of the company in London, or at any of the Company's branches.—The Cobden Tea Company (Limited), 22, Charterhouse-buildings, Goswell-road, London, E. C.

CROSS-BREEDING OR INTER-BREEDING.

It is hoped that what has recently been written and said in relation to what is really hybridsation. will have cleared the air of the kind of cant that has been too plentiful in relation to it. It seems even needful to define what is really cross-breeding, because almost everyone who is engaged in fertilising flowers with pollen taken from other flowers that are precisely alike, perhaps, in every respect [No.] but colour, refers to such acts as cross-breeding or fertilisation [Why not? Ed.]. Because so much fertilisation is done by hand, it by no means follows that cross-breeding is performed. The proper term for work of that description seems to be more fitly described as "inter-breeding," which simply means inter-crossing allied flowers one with another that differ only in colour. True hybridisation, I take it, cannot possibly be performed between two genera or species that are absolutely dissimilar botanically. What is recognised as hybridisation presumably consists of combinations of members of the same genera that, all the same materially differ in appearance. A notable example is found in Harrison's Musk, the product of crossing the common Musk with Mimulus luteus. The old Clove Pink is another such family hybrid, and probably the now well-known Marguerite-Carnation is another. I once obtained such a hybrid by crossing Digitalis luteus with pollen of Digitalis purpureus, or the garden form of it. Mr. Smythe has the same sort of hybrid in his product of crossing Dwarf Kidney and Scarlet Runner Beans. But then, some of such products, as Harrison's Musk, for instance, are seedless, whilst some others, because the connection is of a less violent order, are free seeders. Crossing Sweet Peas with Lathyrus grandiflorus, Potatos with Tomatos. Melons with Cucumbers, would be real hybridisation; but Sweet Peas or edible Peas, or Potatos or Tomatos, one with another, is only inter-breeding, yet has probably been productive of more valuable results to gardening than has true hybridisation.—"A. D.", in *The Gardeners' Chronicle*.

THE GLORY OF MAN.

The crown and glory of manhood is strength—power. All human conquests have been won by it; individual and collective. The earliest sign of decay in man is not usually pain, but weakness of some kind—of mind or body, or both. This may be the inevitable sequence of advanced years, or it may, as we all know, show itself at any period of life. But it always means that the sources of strength are failing, as the lessening of the water in a river means a drying up of the springs and streams which feed it.

I said "*sources*" of strength, using the plural word. I should have said "*source*" of strength, for in human beings there is but one. What is it? Perhaps the experience of Mr. David Jones will help us to an answer.

"In the summer of 1881," he says, "I began to feel ill and out of sorts. I was weak and tired, and quite worn out with little exertion. I had a poor appetite, and after eating had pain and weight at the chest. My secretions were scanty and thick. My back felt stiff, and gave me much pain as I moved about. For three years I suffered like this, being at times better and then worse. I consulted a doctor, who gave me medicines and recommended Turkish baths; but I got no better for any kind of treatment.

"My brother then told me about Mother Seigel's Curative Syrup, but I had no faith in advertised medicines. He, however, urged me to take it, and after taking a few doses I experienced so much relief that I continued with it, and was soon *strong and well as ever*. Since that time I take a dose of this remedy when I feel at all ailing, and it sets me right. I have praised Mother Seigel's Syrup to all my friends, many of whom have tried it and been benefited by it. You can publish this statement as you like. (Signed) David Jones, 1 Dunlee Street, Walton, Liverpool, July 31st, 1896."

We have room for one more short letter before we try to come at the answer to the question with which we set out It is exactly in the same line, and ought to make the results for our inquiry all the more clear and plain.

"In the spring of 1888," proceeds the writer, "my health began to fail me. I felt languid and heavy, as if something had come over me. I had a bad taste in the mouth, my appetite was poor, and the little food I took gave me pain across the chest and between the shoulders My food lay like lead on my stomach. I was constantly spitting up a thick phlegm, and when in bed *heavy sweats came over me*. I got weaker and weaker, and from time to time was confined to bed. Often I was so bad I could not dress or undress myself.

"Now better, now worse, but never well, I suffered for over five years. I took different kinds of medicines, and had a doctor, but got no real benefit from anything.

"In July, 1893, a book was left at my house in which I read of cases like mine having been cured by Mother Seigel's Syrup. I got a bottle from the International Tea Company, Yeovil, and began taking it. In a short time I felt much benefit, and, by continuing with it, *gained strength* I could eat better, food agreed with me, and by-and-by I was *strong and well*. But for Mother Seigel's Syrup I believe I should not now be alive. You are at liberty to publish this statement. (Signed) (Mrs.) Jane Crouch, 82, Huish, Yeovil, November 29th, 1895."

What, then, do these cases show to be the *source of strength?* The answer is, *Digested Food*. That and nothing else. All strength, of body or of mind, comes from that, and that only. What, then, is the great enemy of strength, the fountain of weakness? Indigestion—dyspepsia. You see why and how. A child could not miss the argument. What, then, restores strength? Mother Seigel's Syrup. In what way? By setting the digestive machinery in healthy operation. That is what it did for our correspondents and does daily for multitudes. Use it if you need it, and pass the news to other weak ones.

MARKET REPORT.

By Mail Advices of 6th October 1899.

COFFEE.

The London Commercial Record says:—The market opened quiet with a tendency to ease, except for the most desirable qualities. Latterly the market became flat in consequence of the stringency in the discount market, and at yesterday's auctions a considerable proportion of the supplies on offer were withdrawn in the absence of adequate bids. Plantation Ceylon declined materially, but East India did not alter much, except for bold Coorg, which advanced somewhat. "Futures" have been somewhat irregular, but closing prices show only an occasional 3d loss, viz.:—

London ...	Santos ...	December delivery ...	26s. 3d.
New York ...	No. 7 Rio...	„ „ ...	4·60 cents.
Hamburg...	Santos ...	„ „ ..	27 pf.
Havre ...	Santos ...	„ „ ...	32¼ francs.
Holland ...	Good ordinary Java ...	...	26 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.

	1899.	1898	1899.	1898.
Tons ...	12,377	10,762	19,622	19,048

The preceding figures exhibit— Tons.

In the Imports an increase this year of	1,529
Home Consumption an increase of	1,615
Export an increase of...	574
Stock an increase of	4,079

Auctions this week have gone off as under:—

Ceylon.—*Plantation.*—32 casks 7 tierces 39 barrels 5 bags partly sold, common colory 40s, low middling to bold dull colory 66s to 85s, pea-berry 65s to 75s.

East India.—2,698 bags partly sold as follows:—*Mysore*, smalls 32s, low middling 34s, pea-berry 40s to 47s; *Coorg*, smalls 33s to 41s, middling colory 51s to 54s, bold 71s to 80s 6d, pea-berry 45s to 90s; *Neilgherry*, smalls 32s, low middling to middling 34s to 44s, pea-berry 40s to 49s; *Nelliampathy*, smalls 23s, low middling 38s; *Wynaad*, smalls 33s to 35s, low middling 34s 6d to 39s, bold 48s, pea-berry 43s 6d to 45s.

Jamaica.—12 barrels 21 bags sold—ordinary to fine ordinary 21s 6d to 31s, pea-berry 40.

Nyasaland.—115 bags mostly sold—ordinary to fine ordinary greenish 28s 6d to 36s 6d, pea-berry 37s to 41s 6d.

Costa Rica.—Of 2,186 bags offered about 1,300 bags sold—smalls 23s to 38s, ordinary to fine ordinary greenish 31s to 37s 6d, low middling 44s 6d to 48s 6d, bold 58s to 86s, pea-berry 32s 6d.

Guatemala.—804 bags offered and 470 bags sold—smalls 26s 6d to 35s, ordinary 30s, middling brownish 43s, bold blue 55s, pea-berry 47s.

Salvador.—2,181 bags catalogued only 580 sold—smalls 31s, good to fine ordinary 33s to 36s, low middling to middling 41s to 44s, good bold colory 54s to 57s 6d, pea-berry 58s 6d to 60s.

Nicaragua.—Of 209 bags offered 150 bags sold—smalls 31s 6d, low middling brownish 41s.

Colombian.—2,152 bags offered 1,300 bags sold—smalls 25s to 37s 6d, low middling to middling 39s 6d to 46s 6d, good middling to blue 48s 6d to 55s 6d, bold 50s to 69s, extra bold 75s to 96s 6d, pea-berry 43s to 90s.

Mexican.—992 bags offered and 400 bags sold, small 29s to 33s 6d, low middling 39s 6d to 40s, bold 50s to 61s, pea-berry 54s to 60s.

Auction supplies to-day consisted of—7 casks 4 barrels 1 tierce Plantation Ceylon, 325 pkgs East Indian, 93 bags East India Liberian, 18 pkgs. Mocha, 202 bags Nyasaland, 42 barrels Jamaica, 498 bags Nicaragua, 985 bags Guatemala, 344 bags Salvador, 988 bags Columbian, and 99 bags Costa Rica. The auctions went off with fair demand at steady rates.

Receipts in Rio and Santos.

TEA.

China.—Auctions during the week have offered 2,754 packages, which have experienced a very poor enquiry, only a small proportion selling—Congou Saryune at 6½d, Souchong at 6½d to 7¼d, Panyong 7d, Keemum 7½d. Oolong 5⅝d to 7⅜d per lb, which prices show a decline, especially on the last-named description.

Indian.—Public sales were slightly heavier totalling 45,600 packages *versus* 44,600 packages in the week before and 50,600 packages at this period of 1898.

Partly owing to a temporary lull in the country demand there was not quite so much animation in the bidding, especially for the less desirable liquoring invoices. Common to medium leafy kinds in some instances were a point cheaper, but quotations for other sorts showed little alteration except when (as in the case of some of the Assams) quality marked a falling off. Prospects of considerable delay in transport on account of the recent landslips, seemed favourably to affect the market for Darjeelings as traffic on the railway there will be suspended for a while. Finest, particularly tippy lots, brought high figures, notably Assam:—Beesakopi Estate, BOP 2s 5d and 2s 2½d, BP 2s 1¼d; Hokungoorie Estate, BOP 2s 4½d; Pabbojan Co., BOP 2s 3½d; Sookerating Estate, FOP 2s 2¼d; Suddia Road Co. BOP 2s 2d, FOP 2s 0½d; Talup Estate, BOP 2s 1½d; Hansura Estate, BOP 2s 1d; Deamoolie Co., BP, and Scroon Estate, BOP 2s 0½d per lb. Darjeeling:—Soeyok Estate, BOP 2s 1½d; Margaret's Hope Estate, BP 1s 11½d, OP 1s 10d; Marmah Estate, BOP 1s 8¾d bid; Arya Co., BOP, and Ting Ling Estate, BOP 1s 8d; Badamtam Estate, BOP 1s 7⅜d per lb.

For 35,000 packages on Garden Account 9¼d per lb was realised, compared with 8½d per lb. for 39,400 packages and 9d per lb. for 32,700 packages in the two preceding seasons.

Deliveries for September were good, viz., 12,299,000 lbs., contrasted with 11,354,000 lbs. in 1898, and 10,161,000 lbs. in 1897.

Entries for export to the United Kingdom from 1st April to 30th ultimo were 75,692,000 lbs. opposed to 69,917,000 lbs. a year ago.

Ceylon.—The amount put forward was rather larger, being 30,300 packages, against 27,300 packages on the 26th ultimo and 18,000 packages in the previous year. A good enquiry existed for most descriptions, and the auctions passed without much change. Dealers, however, seemed more eager to secure Pekoe Souchongs and Pekoes up to 6½d per lb. than the medium grades of the latter, which occasionally passed at fractionally lower rates. Broken Pekoes with full and useful cup received attention and ruled firm, but parcels lacking these characteristics sometimes went in favour of buyers. Finest elicited brisk competition, and the following invoices gave some of the best results:—Goatfell Estate, Car TCo., 105 packages, 1s 2¾d, Gonamatava Estate, GCELd., 72 packages, 1s 2d, Mahadowa Estate, 60 packages, and Park Estate, NETCo., 76 packages, 1s 1¼d, Brookside Estate, ST&LCo., 60 packages, 1s 0½d, Mahagastotte Estate, 56 packages Ragalla Estate, 166 packages, and Talawakelle Estate, 87 packages, 1s 0¼d per lb.

The average is 8⅜d per lb. On the 28th ultimo it was 8¼d per lb. and 8½d per lb. in 1898.

September clearances from the London warehouses were satisfactory, being 9,699,000 lbs., while for the same month in the two foregoing years they were 8,469,000 and 8,937,000 lbs. respectively.

Java.—Catalogues included 1,200 packages of direct import which sold with less spirit, some lots being withdrawn owing to offers being below limit. Nearly 1,600 packages are advertised for the 12th instant.

Deliveries —The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns continue to be satisfactory, viz.:—

	Lbs.
From 1st to 30th Sept., 1899	19,145,666
Do. do. 1898	17,143,946

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	37,402	8,243	45,645
Ceylon ...	27,987	2,355	30,342
Java	698	538	1,236
Total .	66,087	11,136	77,223

Also 1,506 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 6th, 1899, says :—

Quantity brought to Auction in London from 1st June to Date.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1899-1900	461,215	411,149	21,468
1898-1899	433,019	448,315	16,677

17,635 *pkgs.* Indian
40,637 ,, Ceylon
31,236 ,, Java
} Total 79,508 packages were offered in public auction this week.

The exceptionally heavy deliveries during September were probably due to the cessation of auctions during July and the greater part of August. The same cause doubtless influenced deliveries from the 1st June, which, taken as a whole, must be considered satisfactory.

Indian.—Bidding was not quite so animated as last week; no actual change can, however, be quoted, except that medium Teas were occasionally fractionally easier. Fine flavoured Teas continue to sell at high prices. Official advices from Calcutta give the export to U.K. for the second half of September as 11,020,000 lbs., against 11,750,000 same period last year, the total from 1st April to 30th September being 75,692,000 lbs., against 69,917,000 lbs in 1898. The following averages are worthy of note:—"Margaret's Hope," 1/8; "Amal. TCo., Dooteriah," 1/6½; "Darj. C.T. Ling," 1/5½.

Week's av. of Tea sold on Garden Account 1899—36,018 pkgs., av 9·12d. 1898, 40,020 pkgs., av. 8·33d.

Total Tea sold on Garden Account 1st June to date 1899—313,403 pks., av 8·59d. 1898—304,867 pkgs.. av. 8·91d.

Ceylon.—With somewhat heavy auctions, comprising 30,637 pkgs., against 27,680 pkgs. last week the recent activity in the market was not quite so pronounced, buyers showing less disposition to compete at current rates. This resulted in occasionally easier quotations, more especially in medium grades. Choice liquoring Teas sold well and Teas for price continued fairly steady. The official wire from Colombo gives shipments to U.K, during September as 7,500,000 lbs., against 7,500,000 lbs. last year, and estimates the quantity available for current month as 7½ to 8 million lbs. The quantity exported to U. K. from 1st January to 30th September was 77,250,000 lbs, against 74,500,000 lbs. The following averages may be mentioned:—"Carolina T. Co. Goatfell," 1/2¾; "Gen. Cey. Est. Co. Gonamatava," 1/2¼," "Madulseema Co. Mahadowa" and "Nuwara Eliya Co. Park," 1/1¼; "S T & L Co. Brookside, 1/0½; "Mahagastotte Ragalla" and "Talawakelle," 1/0¼.

Average for week 8·25d., against 8.42d. same period 1898.

Ceylon Tea soldon Garden Account 1st January. to date 1899—815,561 pkgs., av. 7.96d. 1898—888,725 pkgs., av. 7·67d.

Java.—The auction passed with fair spirit, although in sympathy with other grades competition was not so marked, although some fair Teas were offered.

(IN THE UNITED STATES.)

On Wednesday, September 6, the Montgomery Auction and Commission Company sold 4·643 packages tea, viz., 629 Moyunes, 536 Pingsueys, 68 basket-fired Japans, 182 Congous, 66 Indias, 174 Foochows and 2,995 Formosas. Terms net cash in bond, unless otherwise stated.

Greens.—The offering was small, and an improvement of ¼ at ½c was shown.

304 packages fine liquor Moyune sold as follows: 26 double half-chests rather good extra Gunpowder, 21½c; 29 half-chests good first Gunpowder, 17c; 23 half-chests rather good first Imperial, 16c; 9 half-chests poor second Imperial, 12½c; 24 double half-chests good extra Young Hyson, 16½c; 88 half chests fair first Young Hyson, 13c; 92 half-chests good second Young Hyson, 11½c; 13 half-chests plain third Hyson, 11c. Average, 14.05c.

105 packages good medium liquor Moyune sold as follows: 11 double half-chests good extra Gunpowder, 2 1c; 9 double half chests good first Gunpowder, 16½c; 6 half-chests plain first Imperial, 15c; 10 double half-chests good extra Young Hyson, 16½c; 34 half-chests plain first Young Hyson, 12½c; 23 half-chests good second Young Hyson, 11½c; 12 half-chests good third Hyson, 12c. Average, 13.97c.

Pingsueys.—Previous rates were well maintained.

278 packages fully medium were sold as follows: 110 boxes good first Gunpowder, 15c; 102 boxes good plain first Gunpowder, 14½c; 66 boxes good first P. L. Gunpowder. 14½c. Average, 14.70.

Japans.—Pan-fired: None offered. Quotations are: Choicest, 29½c; finest. 27 at 27½c: fine, 25½c. Sun-dried: None offered. Dust and nibs: None offered.

Congous.—Duty paid, Quotations are: Fully medium Pecco, 22c.

Amoys None offered.

Foochos.—Duty paid. Quotations are: Good, 22c.

Formosas.—The offering consisted mainly of grades below superior. Prices realized were on a parity with previous sale. Two small lines of fine tea. printed, showed a marked advance. Quotations are: Fine, 20c; superior, 13½c; good, 11¾ at 12c; fair, 11½c.

COCOA.

Auctions were limited to the small supply of 1,558 bags which small supply attracted but little attention. Under the hammer about 420 bags sold without much change in prices. Of 153 bags Trinidad offered barely 50 bags sold—fine red at 72s to 72s 6d. 247 bags Grenada were placed at valuations, fully fair at 64s. 257 bags Bahia partly sold at 58s for grayish, being about steady. Of 155 bags Samana a few bags sold at 55s 6d to 58s 6d. 29 bags Surinam, 264 bags Guayaquil and 78 bags Java retired unsold. Of 385 bags Ceylon offered about 70 bags sold firmly—good bold bright red 80s, fair to good small red 49s 6d to 58s 6d, blacks 45s 6d per cwt. Privately 200 bags Trinidad sold at 71s to 73s 6d for good to fine red, 25 bags Puerto Cabello at 115s, and 1,000 bags Guayaquil—good Arriba 69s 6d to 72s and grey Caraquez 65s per cwt.

PEPPER.

Black.—The market remains very quiet, and values are lower. Of Singapore, about 50 to 60 tons have been sold, viz., on the spot at $5\frac{9}{16}$d, September-November shipment at $5\frac{21}{32}$d, October-December at 5¾d, and February-April at $5\frac{13}{16}$d. 25 tons September-March delivery have been sold at $5\frac{11}{16}$d to 5¾d.

At auctions on Wednesday 180 bags Penang, weight 3 lbs. 11 ozs. dust 5·11 % per gallon, were bought in at 5½d, a bid of 5d per lb. being refused.

The shipments of Black Pepper for the month of September compare as follows:—

	1st-half. 1899. Tons.	1st-half. 1898. Tons.	2nd-half. 1899. Tons.	2nd-half. 1898. Tons.
U.K.—Sing. ...	180	430	40	160

GINGER.

Cochin.—A new departure has been made this week, business having been done for forward delivery for the first time in this article. 500 bags unassorted Calicut rough sold for January delivery at 26s 6d, and 500 bags Cochin washed rough for February delivery at 25s 6d, and further business in the latter up to 26s 3d. On the spot a fair enquiry exists and about 500 bags medium and small washed rough have changed hands at 23s 6d to 24s per cwt, showing a steady market. Under the hammer only 76 cases 75 bags were offered of which 13 cases medium, some small, Calicut rough, rather mouldy, sold at 25s 6d per cwt.

CARDAMOMS.

Since the auctions there has been a brisk inquiry, and full t dearer prices have been paid.

CINCHONA.

The Amsterdam correspondent of *The Chemist and Druggist*, writin on October 2, reports that the shipments from Java (according t the figures of the Nederlandsche Vriesse veem) were as follows:—

—	1899.	1898.	1897.	1896.	1895.
Amsterdam lb Supt.	1,232,000	790,000	1,051,000	1,389,000	816,00
January-September ...	8,462,800	7,926,000	5,982,000	7,418,000	5,829,70

The shipments from Ceylon for the week ending September 1 were 535 lbs. only, and the total exports from January 1 to Septem ber 12 were—

	1899.	1898.	1897.	1896.
Lbs.	483,690	690,788	526,093	881,743

QUININE.

On September 29 German makers announced a reduction of 1½d per oz. on the sulphate, and they now quote 11½d. per oz. for 1,000-oz lots. Howards' price is now 1s 2d. for 100-oz lots in 100-oz. tins, and 1s. 3d. in vials for 1,000-oz. lots. Whiffen's quote 1s. for 100-oz. tin and 11½d. for 1,000-oz. lots. Other salts have been proportionatel reduced. Immediately after this reduction second-hand sales o good German brands were made at 10¼d. for December delivery and the week closed with buyers at 10¼d, and sellers at 10½d. pe oz. On Monday there was a slight recovery, 10½d. being paid fo 6,000 oz December delivery, which improvement was maintaine on Tuesday, when some 25,000 oz. changed hands at 10¾d. to 10⅞d for December, and 10½d. per oz. spot, and on Wednesday ther were further sales at these figures. To-day 11d. spot or for Decem ber delivery is asked with buyers at 10⅜d. to 10⅞d. per oz. The ex ports from Java during July were 28 cases shipped to Amsterdam

Movements of Tea in London (in lbs.) during September.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," Agra Bank Buildings, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 10th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *1st November.*—*Weather.*—Cloudy and muggy mostly. Very little rain. Some yesterday. *Plant-diseases.*—The weather is keeping leaf-disease going. *Crop.*—Full picking will not be begun till the middle or so of the month. Some places will be even later. *Labour.*—Ample. *General Health.*—Good.

CINCHONA AND QUININE ON THE NILGIRIS.

In our present issue we give extracts from the Annual Administration Report on the Government Cinchona Department, Nilgiris, for the year 1898-99. A favourable season for the plantations was, unfortunately, accompanied—so to speak—by an unfavourable season for the sale of quinine and febrifuge. This latter fact, coupled with the initiation of a system of holding a reserve stock of chemicals, has given an unusual turn to the income and expenditure accounts; but there is no reason to suppose that the financial position of the Department is unhealthy. The receipts of the year amounted to Rs.91,039-2-8, or some Rs.9,000 less than was anticipated; the expenditure to Rs.1,94,603-14-1, or about Rs.7,400 less than was budgetted for. There was a fall in the price of bark during the year, which enabled a saving of Rs.29,680 to be effected, but of this the Director spent Rs.11,487 in laying by an extra stock of chemicals. The necessity for larger stocks of this kind was demonstrated a

year or two ago, when the factory had to suspend operations for some time owing to the loss, at sea, of a quantity of fusel oil. At the end of the year 1898-99 the Department's stock included purchased bark to the value of Rs.10,500 ; oils and chemicals, Rs.20,000 ; febrifuge, 11,274½ lbs., and a reserve of Government bark in store amounting to 228,956 lbs. Taking stocks at cost the value, at the close of the year, exceeded the opening balance by Rs.1,38,083, and Mr. STANDEN remarks that, if the quinine in store were taken into account at its current market value, "the profit for the year would have been Rs.1,32,815-1-7."

Dodabetta plantation was well cultivated and manured during the year, and continued to flourish. The total rainfall was 52·05 inches. There were the usual frosts in December and January ; but the damage done was slight. Mr. STANDEN observes, with particular satisfaction, that the oldest trees were among the healthiest and most vigorous on the estate, and that they responded readily to manure and cultivation. The plants raised from Jamaica seed were found to be, with a few exceptions, hybrids of various types, and not the true *officinalis*, or crown bark variety. On the other hand, the satisfactory growth of the plants raised from estate seed "tends to show that the local seed has not deteriorated, and that the want of success that attended the planting of recent years and led to fears of deterioration of local seed was due to the character of the old land planted, and not to any diminished vigour in the plants themselves. The importation of seed from Jamaica has thus proved to have been an unnecessary, as well as an unsatisfactory, experiment. At Nedivattam the oldest portions of the estate were looking well. Here, too, planting on old land has not proved successful, and has now been definitely abandoned, "though an experiment, on a small scale, will be tried in 1899-1900 with plants grown under shade on old land." It is intended to utilize all ground which has been denuded of cinchona for the growth of fuel trees, which will help to meet the large fuel requirements of the factory. At Hooker, again, second crops of cinchona are proved to be inferior in vitality to those grown on virgin land. The extension of 80 acres of forest-land planted during June, July and August promises to be a great success. About twenty years have elapsed since any extension of cinchona cultivation was made on the Government estates on new land and it is, Mr. STANDEN observes, "very satisfactory to note the difference between the growth on the new land and that on old land." This is one of the most important features of his report, to judge from the planter's point of view. Two other very interesting sections are those dealing with Manure and Nurseries. Mr. STANDEN's remarks under these heads are given in full on another page. The total quantity of bark harvested on the three estates during the year was 101,307 lbs., consisting of 89,354 lbs., crown and hybrid barks, and 11,953 lbs. of red barks. Purchases from private growers amounted to 405,074 lbs. The cost per pound of the year's crop is put down at As.7-4·81 per pound.

Turning now to the work of the factory, we note that the total amount of bark worked up was 461,717 lbs., and the alkaloids extracted amounted to 19,841 lbs., of which 12,603 lbs. were sulphate of quinine and 7,238 lbs. febrifuge. It was found possible, without incurring any expenditure on additional machinery, to increase the quantity of bark treated daily to 1,500 lbs., and thus there was a very considerable increase in the output of alkaloids. It has, in fact, been demonstrated that the factory, without any additions, is fully equipped to wor up to an output of 12,000 lbs. of quinine per annum, at th lowest. Mr. STANDEN says that, as at present equipped, th factory is able to deal with at least 450,000 lbs. of quinine yielding barks per annum ; the outturn of quinine woul depend on the quality of the bark treated. It is furthe stated that some of the bark purchased yielded no more tha 1·70 per cent. of sulphate of quinine, while a small quantit of bark from the Whitbeck estate gave the high figure o 6·24 per cent. sulphate of quinine. The total cost of manu facture of febrifuge from red barks by acid process wa Rs.1·4 per pound ; the total cost of manufacture and distri bution of alkaloids Rs.2-4-6 per pound. The febrifuge fron the crown bark is a bye-product in the manufacture o quinine, and is mixed with the febrifuge from the red barks Taking everything into account, the Director thinks it i perhaps right to consider that the 12,603 lbs. of quinine cos Rs.9-9-6 per pound, and the 7,238 lbs. of febrifuge from re and crown bark Rs.4-7-5 per pound. The crown bar worked up during the year, averaged 3·37 per cent. sulphat of quinine, and 1·01 of febrifuge ; and the red barks averaged 3·94 per cent. of febrifuge. Sales to Medical Stores, an Local Fund and Municipal Dispensaries were made at Rs.1 and Rs.10 per pound, respectively ; to the public at Rs.18 an Rs.12, respectively. Demand for febrifuge fell off very much probably owing to the cheapness of quinine ; but the increase of price of 5-grain packets of quinine from two pies to three pies also caused a decrease in Post Office sales of quinine.

Government observes that "the year's working has been highly satisfactory and creditable to Mr. STANDEN and his subordinates. It has been proved that the factory is equa to all estimated requirements, and a considerable stock o bark and of quinine has been accumulated at a cheap cost t meet future demands." What has *not* been proved in the report under review, however, is the need for Governmen extensions of cinchona plantation, or for the increased outpu of quinine, &c., so much of which has simply *helped to swel stocks*. A few remarks on these points would have added very greatly to the interest of the report, which, in its presen form, would appear to justify the inference that the factory i already turning out a larger quantity of alkaloids than is needed to meet the requirements of the public concerned.

THE AMERICAN DEMAND FOR COFFEE.

On more than one occasion we have called attention to the cheapness of Coffee in the United States, as compared with the United Kingdom. It is encouraging to learn that this cheapness is exercising a most important influence on demand The August report of the New York Coffee Exchange shows that the consumption of coffee has increased as it never increased before. Formerly a 10 per cent. gain in consumption from one year to another was regarded as a maximum increase, and even this was the exception and not the rule During years of very high prices there was no gain in consumption, which for three years, 1891-92 to and including 1893-94, remained steady. During that time No. 7, a low grade Rio coffee, sold as high as 17½ cents ; now, it is weak at 5½ cents. In 1896-97 the break to 7¼ cents from 13 cents was made, and the deliveries shot up 749,466 bag here and 351,925 bags in Europe. The next year, 1897-98 they increased still more, but part of this gain was due t

taking coffee out of licensed warehouses in anticipation of a duty being levied, and thus the figures do not represent actual consumption. The next year, 1898-99, ending June 30, the deliveries averaged 473,553 bags monthly in this country. During July and August the deliveries rose to 954,330 bags, against 686,650 bags for the same months last year, a gain of nearly 40 per cent. Usually the demand during the summer months is the lightest of the year, but this year the summer consumption is a little above the monthly average for the year. The low price, coupled with extensive advertising of coffee done up in packages, each containing a coupon for a prize, has enormously increased the demand among the working-classes. This package coffee, absolutely pure, retails for 5d. per lb., and makes two gallons of infusion at a cost of 2½d. One pound of tea of good quality makes six gallons of beverage, and if it costs 2s. per lb. it means a beverage costing 4d.

This refers to China and Japan teas, and accounts for the fact that the consumption of Tea in America is yielding place to the consumption of Coffee. One writer remarks that, if Americans would use Ceylon and Indian tea instead of China and Japan growths, then they would have a cheaper beverage than when using coffee, for one pound of good British-grown tea will make sixteen gallons of beverage at a cost of about 1¾d. per gallon. He adds :—"Slowly but, it seems, surely the people begin to learn how to make a right use of Ceylon and Indian tea, but there is an aversion to using them alone, and so the majority of such tea is used for blending."

Comparing imports for three years, we get the following figures :—

	Tea £bs.	Coffee £bs.
1899	74,088,153	831,820,341
1898	71,957,915	870,514,455
1897	113,347,175	737,645,670

These tell their own tale, though doubtless the imposition of a 10-cent duty on Tea, the Tea Exclusion Act, and a rise in price have done damage to the one industry, while the other has gained by a fall of prices that has made it relatively the cheaper beverage of the two. In regard to this point of the cheapness of Coffee, we would call special attention to the extract from the *American Grocer*, given on another page of this issue, under the heading "The August Coffee Movement in the U. S." The concluding paragraph should help to cheer coffee-planters up a little.

AN EXAMPLE FOR DISTRICT PLANTERS' ASSOCIATIONS.

The *Brazilian Review* draws special attention to the work of O Club da Lavoura de S. Carlos do Pinhal (Planters' Club, and remarks :—"This Association, which has for its aim and object the furtherance of Agriculture and Planters' interests) has sent us the statistics relating to the production of Coffee in its district, by far the most practical and complete of any of the kind we have yet seen. If carried on in this manner the S. Carlos Club cannot fail to be of the greatest use to planting interests ; and, if the coffee crisis has done nothing else, it has certainly awakened every one to the importance of proper statistics, the first step towards their realisation." Before quoting the statistics, our contemporary explains that an *alqueire* of land in S. Paulo is equivalent to 24,200 sq. metres or nearly 6 acre. Then follows the information given by the Club seemingly that settled lands in the Municipality of S. Carlos cover 32,000,000 acres, of which 120,000 are cultivated and 200,000 virgin, or employed for pasturage. The coffee trees are distributed as follows :—

Less than 4 years old	5,750,000
From 4 to 20 years	15,970,000
Over 20 years	5,480,000
Total number of trees ..	27,200,000

More than 56% of all the trees in the district are, therefore, in their best period, four to twenty years, and likely to give large crops for years to come, only 20% having passed full bearing age. The crop for the current year 1899-1900 is estimated at 1,200,000 *arrobas* for the S. Carlos district, which at 8$ per *arroba* will give 9,600,000$000. [The official estimate of the Santos Chamber of Commerce, by the way, gives the return from S. Carlos do Pinhal at only 700,000 *arrobas*.]

The following interesting estimate is given of the cost of production in this district :—

Caring and cultivation (capina) at 80$ per 1,000 trees ..	2.176:000$
Harvesting at 1$ per arroba	1.200:000$
Preparation of the drying ground (terreiro) and cartage to station 1$ per arroba	1.200:000$
Freight per Railway to Santos at 1$500 per arroba ..	1.800:000$
Administration, Repairs, Machinery, etc.	2.200:000$
Commission on sale, 3%	360:000$
	8·936:000$
Estimated yield 1,200,000 arrobas at 8$	9.600:000$
Probable surplus	664:000$

At 8$000 per arroba the bare cost of production, without allowing anything for interest on capital, is just covered, but before prices could fall to such a level very large quantities of coffee from less favored districts must inevitably go out of cultivation altogether. These estimates are based on the prices actually paid in the district, which vary from 70$000 to 150$000 for weeding and caring per 1,000 trees, the predominating price being 80$000 per mil, paid on 124 out of the total of 226 plantations, the next being 100$ on 47 plantations. For harvesting 500 réis per *alqueire* (little less than 1 bushel) of berry is paid on the greater part of the plantations, very few paying 600 to 700 réis. The price for pruning is 20$000 per 1,000 shrub. Day labourers (colonists) receive 2$500 (say, 1s. 8d.,) to 3$ (2s.) a day without food to 70$ (£2-6-8) with food, which is reckoned at about 30$ (£1), per month. There are in the district 12 pulping and 89 other machines for treatment of the berry, exclusive of 68 engines of a total value of about £353,000. Local statistics next given show that the rural population of the Municipality of S. Carlos is estimated at 24,320, of whom 15,688 are labourers. The 226 estates maintain 2,334 mules, 5,078 cows, 2,347 bullocks, 1,055 horses, 220 mares and 420 sheep, of a total value of, say, £60,000. The greater part of the labour is Italian, 10,096 out of the total of 15,688 hands. Not only are statistics furnished with an attempt at completeness that Planters' Associations in Southern India have not yet been persuaded to emulate, but the Club has a demonstrative and experimental annexe, which is expected to prove very useful, *especially in introducing better machinery* and encouraging its use in other branches of agriculture besides coffee. It certainly seems to us that South Indian Planters may learn a good deal from the S. Carlos Planters' Club. Now, when the question of improved cleaning and curing is well before coffee-planters here, would seem an excellent opportunity for studying the enterprising methods of this Club, and for see-

ing if District Associations in Southern India cannot undertake as much as a Planters' Club in a Brazilian Municipality. One of the wealthiest (or shall we say, the least poor ?) of our Associations might take the lead in this matter.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(BY THOMAS BROWN, GLENDALE, COONOOR.)

XIX.

Picking Records—are best kept by entering in the Diary the names of fields and the quantity plucked each day, as follows :—

1899.	27 Saturday.	May.
Picking	No. 10 in progress ..	.. 848
	No. 3 finished ..	.. 80
	No. 9 do. ..	.. 200
	No. 7 in progress ..	.. 927
	No. 5 do. ..	.. 1,165
	Total	.. 3,350

Average per cooly, 32 lbs.

At the end of each month, or whenever convenient, the figures for each field are collected and entered into a sheet kept for the purpose as per sample given.

Flush Account for 1899.

Month.	Field No. 1.	Field No. 2.	Field No. 3.	Field No. 4.
January	1680	1332	1066	957
February	1397	3113	203	64
March	5125	2577	2154	1308

The acreage and number of bushes on each field can be added in the heading as a guide. From such a table, the differences between fields can be readily seen, and the causes clearly ascertained ; while, if the fields are all equal in size, differences will be more readily observed. The figures given in the example are actuals and in Fields Nos. 1 and 2 are about the same size, *viz.*, 13 acres.

The Year's Totals—are more reliable as a guide, since some fields may be plucked on the 3rd, 17th and 31st of a month in which another is plucked on the 11th and 25th only. Then again the earlier pruned fields will show large totals sooner than the later pruned ones. The best time for closing accounts of Tea Gardens is the 31st of December as, about that time, there is usually the smallest pickings.

Leaf Roller or Caterpillar—is best dealt with in the picking, and should not be neglected. The easiest method is to squeeze the affected leaf between thumb and forefinger (this smashes the worm inside), and pick off and throw down the shoot, afterwards. This pest gives little trouble if this method is systematically followed out. Each caterpillar becomes a moth in due time, which lays a large number of eggs. Picking off to carry away and burn is needless. Many of the worms crawl away before they are wanted !

Should a light topping—only have been the prune given, the shoots must be plucked as fast as they appear, and in a case of this sort down to the fish-leaf, or flushing will soon cease, and the energy of the bush probably expended in the production of seed. Leaf from such bushes will be found very light and the weight picked by each cooly small. Tea made from it is spongy and and flavourless.

CRITICISM.

Referring to page 882, in *Planting Opinion* of October 2 "Dangerous" criticises the paragraph headed "A New Style of plucking, etc., etc., and says that, if Mr. Thomas Brown referring to a "New Method" that has been started on th Nilgiris, his description of the same is all wrong. H adds :—"I consider his 'remarks' in general that appear i October 21 *Planting Opinion* on plucking and 'yield' mo *especially* the latter, most damaging to our industry on the Hills, which is attracting so much attention at present. Th 'Method,' now being carried out on some estates on the Hills, *has* doubled the yield and *much* improved the qualit all round."

NOTES.

The Dumont Coffee Co. When 17s. 6d. is offered for a £1 share, there is obviously not a ver cheering prospect for original shareholders.

Deterioration of Ceylon Tea. In the opinion of a large Sydne firm, Ceylon tea is now far poorer i quality than it was three years ago.

Liptonia. "I suppose you've come for you tea," said Admiral Dewey, heartily "Is it tea I'm wanting ? Sir Thomas ought to have said "divil a bit I care about beyond the Cup !"

The Drying of Vanilla. The process of drying the Vanill bean by chloride of calcium gives th most satisfactory results in Réunion. Vanilla dried in th manner is said to command higher prices in Paris tha Vanilla dried in the ordinary manner.

Calcutta Tea Sales. At the sales on 24th ultimo, 21,19 packages were sold. There was a goo demand for common grades at previous rates ; but medium an good teas were irregular, with a downward tendency. Th average realised at the tea sales was 6 annas 1 pie.

Cocoa in Guiana. The total crop in Dutch Guiana i 1898 was 2,706,338 kilos. (as again only 383,522 kilos. of coffee), exports of Cocoa amounted 2,830,414 kilos., of which 2,367,015 kilos. went to the Unit States. From French Guiana, 11,817,500 kilos were export against only 429,200 kilos. coffee).

No Duty on Tea Machinery in Ceylon. Under the provisions of Schedule I of Ordinance No. 20 of 1898, it h now been officially notified that th Lieutenant-Governor of Ceylon in Executive Council has bee pleased to order that machinery intended for the followin purposes shall be exempt from duty, *viz.* :—The sifting, with ering, cutting, breaking, packing, and sorting of tea.

London Tea Market. Cabling on 26th ultimo, Messr Gow, Wilson & Stanton report

that the market for Ceylon tea showed a fractional advance : fair liquoring Ceylon Pekoe Souchong, 6½d. (unchanged); average for the week, 8d. (⅛d. up). According to Reuter, 21,000 packages Ceylon and 41,000 packages Indian were sold out of offering of 22,000 and 47,000, respectively. The average price of Indian tea was 8⅜d. (⅜d. down).

The Plague and Coffee. After remarking that shipments of Coffee were heavy in August and would be still heavier in September, the *Brazilian Review* adds :—that unfortunately the outbreak of 'bubonic plague' in Portugal, and the subsequent enforcement of quarantine on the steamers that call there, has upset trade and regular shipments to an unforeseen degree. The rate of freight has risen "and poor Brazil has to make up this difference, too."

Overlooked. The *Critic* lately stated that French Imperialism is founded on Coffee and Cognac ; the British variety on tea and bottled beer. An irate coffee-*cum*-tea-planting Scot writes us :—"Where does Scotch Whiskey come in ; surely Spencer's '*Imperial* Highland' should not be forgotten." *N.B.*—This is not an advertisement ; but is merely intended to hint that Scotch Whiskey should have been referred to instead of bottled beer—the latter being largely of the "Made-in-Germany" order, *viz.*, Pilsener.

Ceylon's Exports of Tea. According to Messrs. Forbes and Walker's latest circular. Ceylon has shipped altogether nearly four million lbs. more to October 17th than in the same period of last year. To the United Kingdom it has despatched 81,906,599 lbs. against 78,979,136 lbs., to America 2,344,571 lbs. against 1,906,333 lbs., to Australia 12,580,425 lbs. against 12,491,696 lbs., and to Russia 2,719,244 lbs. against 2,021,285 lbs. The export to Australia is nearly stationary : those to America and Russia show a slight increase.

Colombo Tea Sales. At the public sales of tea at Colombo on 25th ultimo, about 10,140 pkgs. =797,562 lbs. were offered, of which about 7,883 pkgs.= 612,041 lbs were sold. The general quality of teas offering this week was not quite up to last week's. Prices throughout the sale were very irregular. Common leaf grades were sold at about previous rates, and common and medium brokens were rather easier. All fine teas fetched full rates. Good invoices were offered from Blinkbonnie, Monkswood, Middleton, Knavesmire, Agra Ouvah, Mocha, Glasgow, and Maskeliya.

Reduction of an Export Duty. By a new law under consideration in the State of Minas Geraes, the object of which is to gradually substitute such taxation for the anti-economical and burdensome export duties levied in all the Provinces on all kinds of produce leaving either for other States or for foreign countries it is proposed to provide that the duty on coffee exported from the State of Minas Geraes shall enjoy a reduction of 2 % (11 % to 9 %) commencing with the next fiscal year. Should the land tax yield more than 2.500:000$, the export duties on coffee, tobacco, cattle and swine shall all be reduced in proportion to the excess.

Cocoa in Hayti. Deliveries of Cocoa in Hayti have increased considerably. During 1898 about 1,000,000 lbs. were shipped, at prices ranging from 18dol. 50c. to 24dol. per 100 lbs. Exchange varies so much that it is difficult to say what these rates mean in sterling, but they can scarcely run to less than, say, 36s. 3d. to 47s. per cwt, and might even represent 52s. to 67s. with a favourable exchange from Coffee to Tobacco. Indian Coffee-planters will be glad to learn that the low prices of coffee (and logwood) in the European and American markets have induced enterprising people in Hayti to turn their attention to other articles. The island is not a very important producing centre, but every little helps ; and the news that tobacco is being grown instead of coffee is good news.

Japan Tea in the North American Continent. Statistics of the exports of Tea from Japan to the United States and Canada for the season of 1898-99 are as follow :—

EXPORT.

	Pounds.
From Yokohama	25,946,020
From Kobe	13,985,219
Total ...	39,931,239

DESTINATION.

New York and East	9,963,328
Chicago and West	13,340,815
San Francisco and Pacific coast	4,362,089
Canada	12,265,007
Total ...	39,931,23

Cardamoms in Travancore. We read in the latest Administration Report :—Under the new system the cultivation of cardamoms is increasing with great rapidity and European planters are now entering on the business. This should develop production not merely in quantity, but in quality and price—a most desirable result, since Travancore cardamoms appear to sell at about half the rate of the Mysore article ; it seems a matter of new seed and proper curing. During the year 319 new pattas were issued for 6,000 acres of forest land, and 6,000 acres more have been applied for and are under survey. In a few years cardamoms should be a source of large revenue even at the present rate of Rs.6-4-0 per acre. The business is one which requires and will repay much care in fostering and management by the Sirkar and by planters alike. It has the advantage of utilizing and not injuring the forests.

The Ceylon Planting Situation. A retired planter proprietor writes to a Colombo contemporary :—"You seem to be getting on very quietly and comfortably in the spicy island. We begin to hear much of blights on tea, and, as the soil becomes more exhausted, I fear we may hear more. I believe the best remedy is 'plant grevilleas.' I have had nearly the whole of my estate planted with them, far too thickly no doubt ; but it is easy to cut them out afterwards. They shed an immense quantity of leaf which protects the soil, keeps the roots of the tea cool, and also manures them. The Ceylon Association in London did not do themselves much credit over the late dispute with the buyers. Mr. Rutherford, for whom I entertain great respect, has not increased his reputation. September is a record month in deliveries of tea—'nine million lbs.'—never before have Ceylon tea deliveries been so large. I hope we may now see better prices again."

Economic Entomology. This is a branch of science that has hitherto been comparatively neg-

lected in this country, says the *Gardeners' Chronicle*. It is probable, however, that, in the Colonies at least, greater attention will be devoted to it, especially in connection with the agricultural development going on in tropical countries. Recently the Government of Ceylon has appointed an entomologist at a salary of 5,000 rupees per annum; and now we learn that it is in contemplation to appoint a scientific man as entomologist to the Imperial Department of Agriculture in the West Indies at a salary of £350 per annum, and a free passage to Barbados. Hitherto the number of persons who devoted themselves exclusively to economic entomology is a singularly small one. In the United States they are far in advance of us in this matter. If, however, there is likely to be a demand for capable men at good salaries, there is no reason why this demand should not be fully met.

Brazilian Coffee.

Writing on 8th September, the Santos correspondent of the *Brazilian Review* reports:—Our market presents a rather woeful aspect just now, as receipts continue unabated and shipments are light, so that new arrivals, although the stock is sold to a great extent, weigh heavily and a certain quantity is daily offered under special conditions—be it early payment or prompt shipment. Sales under such conditions can naturally only be effected at a discount. The severe quarantine regulations of the Government have upset the whole shipping business and exporters who have to meet invoices thirty days after purchase must work with great circumspection in order not to be overloaded with large quantities of coffee sold and ready for exportation which cannot be moved but have to be paid for. It need, therefore, not surprise us if prices remain low, notwithstanding a heavy fall in exchange; in fact, we have to quote: 5$900 to 6$100 for "superior" during the week under review.

Abolition or Retention.

In the course of an article on tea the *Investor's Guardian* remarks:—Another source of annoyance is import duty, both in England and America. In this country the duty amounts to 4d per lb., and the Chancellor of the Exchequer derives from this source the comfortable sum of something over four millions per annum. Coffee, on the other hand, pays only about 1d per lb. in import duty, and the spirit of the tea-importer rebels against this "partiality," but in view of the fact that four pence a pound is in itself a moderate duty, and that the impost on tea and tobacco are the only means of obtaining any sensible contribution from the temperate working man towards the expenses of the Empire, it seems unlikely and undesirable that any further decrease should be made. In America, also, coffee is more kindly dealt with than tea, and this was particularly the case during the war with Spain, when a war tax of ten cents was charged upon every pound of tea imported. With the great reduction of the duty in recent years, there has been an immense impetus given to the cup which cheers, and the hearts of good Imperialists especially rejoice at the knowledge that British gardens supply the great bulk of the tea tables of the world with fragrant leaf.

Brazilian Paper Currency.

The *Brazilian Review* of 5th September says:—Including 2,000 contos burned on Saturday, the total, 45,000 contos, corresponding to the emission of funding bonds for the current year and the third part of last year's issue as stipulated in the "funding" arrangement, has now be withdrawn from the circulation and burned. For the ti being the incineration of paper money will, therefore, suspended. The Brazilian Government has, by its str adherence to the terms of the funding agreement, shown determination to faithfully carry out its engagements, and unfortunately, the results are as yet scarcely commensura with the efforts, two points must be held in view—that t quantity of paper money in circulation is not the only fact that governs exchange, and that, even if it were, the amou withdrawn is yet too insignificant compared with the who volume to warrant expectation of a better rate of exchan than actually rules. When the withdrawal of paper mon commenced (in the month of March) the amount in circul tion reached nearly 780.000:000$. To-day it stands at abo 732.000:000$, the reduction from one cause or another bein about 48.000:000$. At the time burning was commence exchange stood at about 6 3/4d. to-day it is at 7 7/8d.

Coffee—Effect of Prices on Consumption.

Le Brésil, commenting on a prote of La Chambre du Commerce d'In portation in which it endeavours t prove by figures that a reduction of French import duties o coffee will almost certainly result in an increase of Custom receipts, in the first place in consequence of increased con sumption of coffee, and, secondly, of that of sugar als remarks:—The following figures show that, as a rule, con sumption increases in proportion to the reduction in prices:—

	Price of Coffee.	*Duties paid.*		*Price of Coffee.*	*Duties paid.*
1874	frs. 148	frs. 60 millions	1887	frs. 96	frs. 99 million
1875	,, 112	,, 75 ,,	1888	,, 82	,, 106 ,,
1876	,, 108	,, 83 ,,	1889	,, 99	,, 101 ,,
1883	,, 55	,, 106 ,,	1896	,, 71	,, 116 ,,
1884	,, 55	,, 106 ,,	1897	,, 46	,, 120 ,,
1885	,, 47	,, 106 ,,	1898	,, 36	,, 123 ,,
1886	,, 54	,, 106 ,,			

Such figures are convincing and show clearly that fro 1897 to 1898, for example, duties collected varied from 99 t 123 million francs, whilst prices fell from 96 to 36 francs pe 50 kilos. The same observation has made in the State where the largest consumption was, in 1897, being 737,695,67 lbs., and corresponded to the bottom prices of $11, or 5 francs, whilst the most feeble, only 423,645,794 lbs., was i 1888 with quotation of $14.2 or 71 francs! Again, in Ge many the consumption of coffee reaches 136,390 tons agains only 77,310 tons in France, a difference out of all proportio to their respective population. It is to the higher dut charged in France that the difference is really due, which at the rate of 156 francs per 100 kilos. as against only 5 francs in Germany.

Attar of Roses.

Exports from Bulgaria durin 1896-98 were as follow:—

	Value.
1896	
1897	£73,752
1898	£71,278
	£103,032

In the last year Turkey took 13·23 per cent; France 38·22 the United Kingdom 21; Germany 21·14; the Unite States, 0·11 and Russia 3%. The British Consul reports:— The changeable weather, which prevailed during the winte months, was most unfavourable for the cultivation of the ros fields, and, although the atmospheric conditions during th period of distillation were all that could be desired, the tota yield was about 2,000 kilos. (or one-quarter) less than i

1897: in other words, about half the splendid crop of 1896. Europe, as well as America, bought less than usual, although prices were low, ranging from £25 to £30 per kilo., a fact which goes far to prove that the adulteration of the attar is still practised to a large extent. The system on which the production of the oil is carried on is, to a certain degree, responsible for this state of things, as the peasants and small proprietors, who receive cash advances from the leading merchants in Kazanlyk, Karlovo, and other centres, usually distil the oil on their own premises without any effective supervision, and thus have every opportunity of practising adulteration with impunity, the oil of geranium being introduced into the country in sufficient quantities by Jews and Gipsies from Andrianople, in spite of the endeavours of the Government to suppress the traffic. Several leading merchants are fully alive to the harm which must eventually be caused to the trade, but the diminution in the yield, which would be the consequence of conveying the roses for a long distance under a burning sun, makes it almost impossible to entertain the idea of confining the distilling operations to a single central establishment. However, buyers have the remedy in their own hands, and a consistent refusal to purchase adulterated goods would doubtless conduce to an improvement in the primitive and unsatisfactory method of production at present in vogue.

GENERAL ARTICLES.

THE BULKING OF TEAS.

The following Memorandum forwarded to a Colombo paper by a London correspondent will afford our tea-planting readers food for a good deal of thought:—

292 packages Ceylon tea, ex *Ophir*, of value £650, sold 1st August, 1899, chested as soon as made, and bulked in London.

Tares ran even and average tares were accepted.

There were bulked	5 chests at 1s. each	£0	15	0
	12 „ 10d „			
	17 chests.			
There were bulked	74 chests at 1s. each	£12	15	8
	218 „ 10d. „			
	292 chests.			
The taring and bulking together ...		£13	10	8 *

Under the Clause G proposed by the Joint Committee for the so-called agreement, 2nd August 1899, insisting on separate tares being taken, the charge would have been—

bulking and taring	74 chests at 1s 5d. =	£5	4	10
	218 „ 1s. 2d. =	12	14	4
	292 packages.	£17	19	2
	say extra charge	£4	8	6 proposed.

The above were bulked in London, because the proprietors are of opinion that London bulking is better in several ways than Estate bulking.

Had the London bulking been forced on the proprietors, as may occasionally happen to every garden proprietor through the tea being thrown up by buyers after sale on grounds of irregularity, the same extra charge would be incurred in every case, even if previously Estate-bulked and tares unquestioned, viz:—

		£4	8	6
and, in addition new Warrants at 4d. new Weight-notes at 2½d.	say = 1d. per pkge.	1	4	4
an extra charge proposed by the Joint Committee for reasons known only to themselves. ...		5	12	10

* Actual cost.

MOSQUITOS—SPECIES ANOPHELES AND CULEX.

Mr. Thos. Christy, F.L.S., writes to the *Ceylon Observer*:—

The readers of your paper may like to make search for mosquitos, and they will have no difficulty in finding a good selection and so be able to ascertain if there are any of the Anopheles species among them, or if they are all of the Culex species.

The detail of work performed on the West Coast of Africa is now published and the reports sent home are so simple and practical that I make free to quote a few remarks from them.

When the mosquito is found on the wall you have to note if his body, with the tail, is parallel with the wall; if so, this species is the Culex and does not carry the germ of malaria; whereas if a mosquito can be found with the head pointing into the wall and the legs sustaining the body in this position and vertical to the wall, that is to say the body projecting at right angels from the place on which the insect is resting, then it belongs to the Anopheles variety and it should be carefully destroyed and a note taken of its existence.

The report gives particulars as to where the Anopheles variety is to be found. The Anopheles is a puddle-breeding mosquito: it requires puddles to breed in, but puddles of a certain kind; hence the importance of the subject. They were found in shallow roadside puddles containing water weed in the middle of the town; then some in a tub. The principal sources yet discovered consist of little pools lying in small flat areas in the towns: here the larvæ are in large numbers and are evidently in presence of the conditions most suitable to their existence. Although search has been made, as yet very few puddles have been discovered to yield this larvæ.

The whole report is most interesting reading and no doubt it will soon be in the hands of the public.

CACAO IN THE PHILIPPINES.

"Theobroma Cacao" (Food of the Gods) as Linnaeus called it, a native of Central America, flourishes in these islands in the hot damp regions. It is said to have been imported into the Philippines towards the end of the 17th century from Mexico, where it has been in very ancient use. Outside the tropics, the tree will grow in some places, but gives no fruit. The Philippine quality is very good, and compares favourably with that of other countries, the best being produced between latitudes 11 and 12 N.

The cultivation of Cacao is an extremely risky and delicate business as, often when the planter's hopes are about to be realized, a slight storm will throw down the almost ripened fruit in a day. A disease sometimes attacks the roots and spreads through the plantation. It is natural, therefore, that no one should dedicate his time exclusively to the cultivation of this product at the risk of almost instantaneous ruin. Usually the Philippine agriculturist rightly regards cacao as a useful adjunct to his other crops. Small quantities of it are sent to Spain, but the consumption in the colony, when made into chocolate by adding sugar, vanilla, cinnamon, etc., to counteract the natural bitterness of the bean is considerable. To make chocolate-paste, a large quantity of sugar is added varying to one-third of its weight to equal parts, whilst one pod of vanilla is sufficient for 1½ lbs. of Cacao. As a beverage, it is in

great favour with the Spaniards and half-castes and the better class of natives.

The cacao beans or kernels lie in a fruit something like a gherkin about five inches long and three inches in diameter, and are of a dark reddish colour when ripe. The fruit contains from 15 to 25 beans, in regular rows, with pulpy divisions between them, like a water-melon. The kernels are about the size, shape and colour of almonds, obtuse at the end, and contain a fatty or oily matter to the extent of one half their weight. In order to make "soluble cacao" as sold in Europe, this fatty substance is extracted.

The beans are planted out at short distances in orchards, or in the garden surrounding the owner's dwelling. The tree, in this colony, does not attain a great height—usually up to 10 feet—whereas in its natural soil it grows up to 30 feet at least. Like coffee, it bears a fruit in the fourth year, and reaches maturity in the sixth year. The fair annual yield of tree, if not damaged by storms or insects, would be about three pint measures of beans, which always find a ready sale.

If all went well, and present prices, more or less, were maintained, large profit might accrue to the planter, but it rarely happens (perhaps never) during the six months of fruit ripening that losses are not sustained by hurricanes, diseases in the tree, the depredations of rats and other vermin, etc. Practically speaking, cacao-planting should only be undertaken in this colony by agriculturists who have spare capital, and can afford to lose a crop one year to make up for it in the next, no planting to be taken up by hand-to-mouth colonists who must seek immediate returns.

In the aspect of a cacao plantation there is nothing especially attractive. The tree itself is not pretty. The natives who grow the fruit usually make their own chocolate at home by roasting the beans over a slow fire, and after separating them from the hulls (like almond skins), they pound them with wet sugar, etc., into a paste, using a kind of rolling-pin on a concave block of wood.

The roasted beans should be made into chocolate at once as, by exposure to the air, they lose flavour. Chocolate is often adulterated with roasted rice and vily nuts. The roasted Pili nut alone has a very agreeable almond taste; the cacao bean itself, in its pure state, is extremely bitter and unpalatable.

In Manila there is a steam power manufactory which partly supplies the capital with good chocolate, and which will receive our attention in a subsequent article.—*Manila Times*, October 4.

THE AUGUST COFFEE MOVEMENT IN THE UNITED STATES.

The marked increase in the deliveries of coffee during August, over the monthly average of last year and as compared with the same month in 1898, is very significant. It shows that low-priced coffee has enormously stimulated the consumption. It is also remarkable that this great gain should occur during July and August, two months, when consumption is usually at the lowest point for the year.

It is evident that the extensive advertising of the article is making a favourite beverage still more popular, and is also reducing the use of tea.

The August deliveries in the United States show a gain over the same month last year of nearly 40 per cent., while in Europe they were only 1·3 per cent. greater. The following statement shows the visible supply and movement for the month:—

	Bags.	Bags.
Stocks, August 1, 1899—		
United States	1,301,834	
Europe	3,755,209—	5,057,043
Receipts during August—		
United States	395,579	
Europe	626,206—	1,021,785
Total supply...		6,078,828
Less stocks, September 1—		
United States	1,176,447	
Europe	3,780,097—	4,956,544
Deliveries, August—		
United States	520,966	
Europe	601,318—	1,122,284
Deliveries, August, 1898		963,052

The total visible supply of the world on September 1 was 7,650,544—an increase over August 1 of 870,501 bags, and showing an increase in the world's visible supply in one year of 1,254,4 bags. The present visible supply is more than equal to one-t the total maximum production of the world for any year on reco

The following table summarizes the general movement for th years:—

	Bags
Visible supply July 1, 1896	2,555,1
Arrivals, United States and Europe, three years (1897-99) ...	43,451,8
Total supply, three years ...	46,004,9
Average yearly supply	15,346,6
Average yearly deliveries ...	13,432,3

This year's supply bids fair to equal that of any former ye An estimate made by Messrs. Duuring & Zoon, Rotterdam, ; the world's crop this year at nearly sixteen million bags, distr buted as follows:—

	Bags.	
Central America, Colombia, Venezuela, and West Indies (1900.		3,250,0
Brazil (1899-1900)—		
Rio	3,875,000	
Santos	6,000,000	
Victoria	450,000	
Bahia	400,000—	10,725,0
Ceylon, India, Africa, etc.		600,0
Java and Padang		1,368,0
Total..		15,943,0
Estimated production, 1898-99		13,609,0
Estimated production, 1897-98		17,744,9

The above statement, coupled with the heavy receipts at Rio an Santos, are sufficient to account for the present weak market an exceptionally low prices.

The receipts at Rio and Santos, July 1 to September 9, 189 were 3,036,000 bags, against 3,052,000 bags for the bumper yea 1897-98.

On the Coffee Exchange, No. 7 Rio coffee sold at 4.20 cents fo October contracts—the lowest price recorded since December, 188 when February contracts sold at 5.25 cents. In June, 1887, Decem ber contracts sold at 22.25 cents, and as late as October, 1894, sale were made at 17.75 cents, or more than four times the presen price of October contracts.

It is always safe to carry a liberal stock of coffee when price are abnormally low. Age improves the bean, but carrying charge must be considered in connection with the probable future of crops If it were not for the extensive area of new plantations in Brazil Mexico, and Central America, that are coming into bearing, i would be conservative to argue that plantations could not produc three bumper crops in succession, and therefore that it was a fai business risk to keep stocks large, with the chances in favor of a crop reduction. Another factor, almost as powerful as supply, is demand. If the United States is going to increase the consump tion at the ratio it did in July and August, it means a gain over last year of over 225,000 bags. The two factors need to be watched closely, with the chances in favor of the supply being more sud denly checked than the demand.

CINCHONA AND QUININE ON THE NILGIRIS.

The following are extracts from the annual administration report on the Government Cinchona Department, Nilgiris, for the year 1898-99:—

[CULTIVATION OF CINCHONA.]

The season was a favourable one for the plantations. The south-west monsoon burst later than usual, but there were no very heavy falls of rain, and the rainfall was well distributed throughout the year. There were the usual frosts at Dodabetta in December and January, but the damage done was slight.

(*a*) *Dodabetta.*—The total rainfall on this estate was 52·05 inches compared with 52·44 inches in 1897-98. From October to March the quantity of rain registered was 22·28 inches against 9·38 inches for the same period of the preceding year.

(*b*) *Nedivattam.*—The total rainfall was 85·51 inches or 22·13 inches less than in 1897-98, but the rain was well distributed.

(*c*) *Hooker.*—On this estate there were 79·41 inches of rain and the number of days on which rain fell was 158 against 141 in 1897-98.

II. FINANCIAL—(*a*) *Receipts.*—The actual receipts for the year amounted to Rs.91,039-2-8 and include Rs.1,917-2-0, the outstandings of the previous year. A sum of Rs.2,775-9-0 was due at the close of the year for quinine and febrifuge, nearly the whole of which was owing by Local Fund and Municipal hospitals. Every effort was made to collect the outstandings before the close of the official year, but for various reasons payment was deferred.

(*b*) *Expenditure.*—The actual expenditure for the year amounted to Rs.1,94,603-14-1. Compared with the actuals of 1897-98 the expenditure in 1898-99 shows an increase of Rs.97,435 and it is necessary to explain how this money was utilized. The excess expenditure occurred chiefly under the heads working charges, propagation, and cost of Europe stores and purchase of bark. Apart from the new extensions and the extra labour required for the factory, the amount spent under working charges and propagation was Rs.908-14-8 less than in the previous year. It was also found possible to purchase a reserve stock of fusel-oil and chemicals. The necessity for holding such a reserve was shown in 1897-98, when the manufacture of quinine could not be started until September owing to the loss at sea of a large shipment of fusel-oil. The actual expenditure under cost of Europe stores and purchase of bark was Rs.1,33,007-7-3 as against Rs.45,819 in 1897-98 or an increase of Rs.87,188-7-3. Of this excess Rs.60,120-4-8 represents the extra expenditure incurred on the purchase of bark from private growers for, while Rs 23,000 were spent in 1897-98 on the purchase of 108,934 lbs. of bark, the amount spent in 1898-99 for the purchase of 405,074 lbs of bark and the payment of a sum of Rs.999-6-5 due on the previous years' purchases was Rs 83,120-4-8. The total expenditure for chemicals, &c., was Rs.49,887-2-7 against Rs. 22,819 in the previous year, or an increase of Rs.27,068-2-7. This extra expenditure was required for the largely increased outturn of quinine and febrifuge and for the accumulation of a reserve stock of chemicals and oils.

The sum spent on head office and plantations including Rs 8,634-12-11 for the new extensions at Hooker was Rs.55,496-0-2, and the amount spent on the purchase of bark, the manufacture of quinine and febrifuge, the packing and distribution of the alkaloids, and the reserve stock of oils and chemicals was Rs.1,39,107-13-11. The excess of the year's expenditure over revenue amounted to Rs.1,03,564-11-5, but as a set off against this sum there remained at the close of the year 57,623 lbs. of purchased bark which cost Rs.10,544-14-3, a reserve stock of oils and chemicals the cost price of which was Rs 20,143-3-10, a reserve stock of quinine amounting to 11,591⅛ lbs. and of febrifuge 11,274½ lbs., and a reserve of Government bark in store amounting to 228,956 lbs. The value of the plantations was also enhanced by the new extension of 80 acres at Hooker.

The balance sheet shows a profit for the year of Rs.35,377-3-3 which, considering the low rate at which the stock of quinine has been valued, may be considered satisfactory. The present market price of quinine is 1s. 6d. per oz., or Rs. 18 per pound. At this rate the 11,591⅛ lbs. of quinine in store would be worth Rs.2,08,640-4-0 and if this valuation had been adopted the profit for the year would have been Rs.1,32,815-1-7.

III. GENERAL CONDITION—(*a*) *Dodabetta.*—This plantation which has been well cultivated and manured during the year continues to flourish. It is particularly satisfactory to note that the oldest trees are among the healthiest and most vigorous on the estate, and that they respond readily to manure and cultivation. In addition to the ordinary weeding 78,595 renovation pits were dug the beneficial effect of which was well marked. Eight acres of new land within the boundaries of the estate were opened, of which 3⅕ acres were planted with plants raised from Jamaica seed, and 4⅘ acres with plants grown from seed gathered on the estate. These plots are looking very well, the failures are few, and the growth vigorous. The small plot of 2 acres opened in 1897-98 with Jamaica plants shows very satisfactory growth, but it is to be regretted that the plants raised from the seed received from Jamaica are, with few exceptions, hybrids of various types, and not the true officinalis or crown bark variety. It was observed in the last annual report that the difficulty experienced in growing a second crop of cinchona on land which had been for many years under cinchona cultivation, gave rise to the question of the deterioration of the crown bark plants raised from seed from the older trees on the plantations, and resulted in the importation of seed from Jamaica, but the satisfactory growth of the plants raised from estate seed on the 4⅘ acres of new land referred to above, tends to show that the local seed has not deteriorated, and that the want of success which attended the plantings of recent years was due to the character of the old land planted, and not to any diminished vigour in the plants themselves. Further evidence on this point is afforded by an experiment at Nedivattam, where a small plot of old land was planted in 1897-98 with healthy Jamaica seedlings and a plot of new land was planted with estate seedlings. The Jamaica plants had every care bestowed upon them, but more than half of them died, and the survivors give little promise of reaching maturity, while the estate plants on the small plot of new land have come on remarkably well and not more than 5 per cent. of them have failed.

(*b*) *Nedivattam.*—The oldest portions of this estate are looking well and the condition of the younger trees consisting chiefly of hybrids which were planted on old land has improved, though it was found necessary to coppice 20,375 sickly trees. The estate was kept in good order during the year. The plants put out on old land in 1896-97 and 1897-98 failed to a large extent in spite of the care they received. The attempts to grow cinchona on old land have therefore been definitely abandoned though an experiment on a small scale will be tried in 1899-1900 with plants grown under shade in old land. It is intended to utilize all ground which has been denuded of cinchona for the growth of fuel trees. During the year 37,750 eucalyptus and acacia plants were put out and arrangements have been made for the planting of a larger number in 1899–1900. The quantity of firewood required for the factory is considerable and the systematic planting of fuel trees is therefore a step which cannot be longer delayed.

(*c*) *Hooker.*—It was mentioned in the last administration report that nearly the whole of this estate is growing a second crop of cinchona and that the trees thus grown are inferior in vitality to those grown on virgin land The condition for healthy growth being unfavourable it is not surprising that the estate has a somewhat patchy appearance For some years past it has been found necessary to coppice a number of sickly and dying trees and during the year under review the number coppiced was 27,891 which yielded 35,573 lbs. of bark.

The No. 1 extension of 80 acres of forest land which was planted during June, July and August promises to be a great success. The plants were all put out in plant baskets, and as the season was an exceptionally favourable one for planting, growth was not checked and the number of deaths has been very small. Many of the plants which measured 3 to 4 inches when put out are now from 18 inches to 2 feet high and all have a fine healthy appearance. The 80 acres comprise two blocks of forest land of 33 and 47 acres, respectively. The former was planted entirely with plants raised from estate officinalis seed taken from young vigorous trees, and the latter almost entirely with plants from Jamaica seed. At present the plots are doing equally well, but the hybrid character of the Jamaica plants is as noticeable as it is at Dodabetta. About twenty years have elapsed since any extension of cinchona cultivation was made on the Government estates on new land and it is very satisfactory to note the difference between the growth on the new land and that on old land.

IV. MANURE.—In the last administration report reference was made to some experiments with artificial manures and it was remarked that at the end of the year the trees would be coppiced and the results of the manures made known. It was decided however to leave the trees for two years under the influence of the manures instead of one year, as the improvement in their appearance was so well marked that it was thought the maximum results would be obtained later on. Samples of 100 lbs. of dry bark were taken from the manured plot and were worked up in the factory. The trees manured with the mixture of bone meal, white castor poonac, nitrate of potash and nitrate of soda gave 5·06 per cent. sulphate of quinine and 1·37 per cent. febrifuge or 6·43 per cent. total alkaloids, and the bark from the plot treated with bone meal, white castor poonac, super phosphates and nitrate of potash gave 4·80 per cent. sulphate of quinine and 1·15 per cent febrifuge or 5·95 per cent. total alkaloids.

On Dodabetta 1,934 cart-loads of stable and cattle manure were put out on 24·06 acres and 52 80 acres were treated with from 4 to 10 cwt. of lime per acre. No manure was put out on Hooker during the year, but at Nedivattam, plots 18, 19, 20 and 7 were treated with cattle manure and plot 28 with artificial manure.

V. NURSERIES.—For some years past it has been found difficult to raise plants in the Dodabetta nurseries. The seed germinated freely and the seedlings came on well until the early showers when

a large number died out. It was thought that the seed had deteriorated, but the same difficulty was experienced with the Jamaica seedlings. During the year under review, however, Mr. H. V. Ryan, the Superintendent of Dodabetta, discovered that the mischief was caused by a number of small nematode or thread-worms which girdle the roots and thus cause the death of the plant. These insects were found in the baskets containing the plants, and an examination of the roots of the plants under the microscope clearly revealed the damage done. As soon as the cause of the mischief was discovered steps were taken to eradicate the worms. About 10,000 plants in baskets were immersed in a strong solution of salt and placed in beds covered with sawdust that had been sprinkled with kerosine-oil. The result so far has been satisfactory as the worms seem to have left the soil in the baskets. Burnt soil is now being used for filling the plant baskets and a new site has been chosen for the nursery.

At Nedivattam and Hooker the nurseries received close attention and there was no mortality among the seedlings raised from Jamaica or estate seed. Two pounds of Jamaica seed and six pounds of seed taken from specially healthy officinalis trees at Hooker were put down and a sufficient number of healthy seedlings has been raised for the No. 2 extension. Eight pounds of eucalyptus and acacia seed were also sown to provide for the planting of fuel trees.

VI. CROP.—The total quantity of bark harvested on the three estates during the year was 101,307 consisting of 89,354 lbs. of crown and hybrid barks and 11,953 of red barks. The amount of bark purchased from private growers during the year was 405,074, and a report showing prices paid the quantity of this bark worked up and the outturn of quinine and febrifuge was submitted to Government on 19th April 1899. At the close of last year the balance of bark in store was 242,139. The additions during the year amounted to 506,381, making a total of 748,520. Of this quantity 461,717 lbs. were used for the manufacture of quinine and febrifuge and 224 lbs. were supplied to medical institutions, leaving a balance in store at the end of the year of 286,579.

VII. BUILDINGS.—The total expenditure under this head amounted to Rs.1,792-10-10 against Rs.1,352-7-7 in 1897-98. The increase was due to improvements made in the factory. The buildings generally were maintained in a good state of repair.

[MANUFACTURE OF QUININE, &C.]

VIII. FACTORY.—Work in the factory was commenced on the 17th June and was continued without interruption until the 31st March. The total amount of bark worked up was 461,717 consisting of 373,967 lbs. of crowns and hybrids, and 87,750 lbs. of red bark, and the alkaloids extracted amounted to 19,841, of which 12,603 lbs. were sulphate of quinine and 7,238 lbs. were febrifuge. It was found possible without incuring any expenditure on additional machinery to increase the quantity of bark treated daily to 1,500 lbs., and the result has been an output of alkaloids very considerably in excess of that of any previous year. In paragraph 7 of G. O., No. 140, Revenue, dated 10th March 1898, the Government considered that at least 10,000 lbs. of quinine should be manufactured during the year, and the reason for exceeding this quantity was to show that the factory without any additions is fully equipped to work up to an outturn of 12,000 lbs. of quinine per annum. If the manufacture had been commenced on 1st April and continued until 31st March the output of quinine would have been over 14,000 lbs. The machinery worked well, and the disintigrator which was worked throught the year, including the driest months, ground up 461,863 lbs. of bark. As at present equipped the factory is able to deal with at least 450,000 lbs. of quinine-yielding barks per annum. The outturn of quinine would depend on the quality of the bark treated. An average of 3 per cent. bark would give 13,500 lbs., while 3½ per cent. bark would give an outturn of 15,750 lbs. of sulphate of quinine per annum. The quantity of bark purchased from private growers during the year was 405,074 lbs. Of this quantity 347,451 lbs. were worked up and 57,623 remained in store at the close of the year. As evidence of the different degrees of richness of natural crown barks it may be mentioned that some of the bark purchased yielded no more than 1·70 per cent. of sulphate of quinine, while the highest analysis was shown by a small quantity of bark from the Whitbeck estate which gave the high figure of 6·24 per cent. sulphate of quinine.

The total cost of the febrifuge extracted from the red bar including the value of the bark used was Rs.32,316-6-4 or Rs.9- per pound and the cost of the quinine and febrifuge yielded by t crown barks was Rs.1,20,960-5-8 or Rs.7-6-1 per pound, but as t febrifuge from the crown barks is a bye-product in the manuf ture of quinine and is mixed with the febrifuge from the red ba it is perhaps right to consider that the 12,603 lbs. of quinine o Rs.1,20,960-5-8 or Rs.9-9-6 per pound and the 7,238 lbs. of feb fuge from red and crown bark cost Rs 32,316-6-4 or Rs.4-7-7 pound. The crown barks worked up during the year average 3 per cent. sulphate of quinine and 1·01 per cent. of febrifuge a the red barks averaged 3·94 per cent. of febrifuge. The avera yield of total alkaloids from the 461,717 lbs. used was 4·29 per ce

The following table gives the outturn of quinine and febrifu since the commencement of manufacture at Nedivattam:—

	Crown and hybrid barks	Red bark.	Total bark.	OUTTURN OF ALKALOID		
				Sulphate of quinine.	Febri-fuge.	Tota alkaloi
	LBS.	LBS.	LBS.	LBS.	LBS.	LBS.
1889-90 ...	6,650	8,600	15,250	234	357	59
1890-91 ...	96,200	...	96,200	2,928	1,050	3,97
1891-92 ...	122,500	22,000	144,500	4,425	3,174	7,59
1892-93 ...	157,771	13,946	171,717	4,933	3,139	8,07
1893-94 ...	52,600	122,400	175,000	2,000	5,775	7,77
1894-95 ...	152,800	43,800	196,600	4,770	1,756	6,52
1895-96 ...	136,000	97,800	233,800	3,600	2,284	5,88
1896-97 ...	237,000	1,100	238,100	7,891	3,350	11,24
1897-98 ...	125,934	114,650	240,584	5,092	6,389	11,48
1898-99 ...	373,967	87,750	461,717	12,603	7,238	19,84

The quinine and febrifuge were sold to Medical Stores, Local Fun dispensaries and Municipal dispensaries at Rs.15 and Rs.10 p pound, respectively. The price charged to the public was Rs. per pound for quinine, and Rs.12 for febrifuge.

[SALES OF QUININE, &C.]

Quinine.—The stock of quinine on hand at the close of last ye was 3,618 lbs. During the year 12,603 lbs. were manufactured, ma ing a total of 16,221 lbs. The issues during the year amounted 4,629⅞ lbs. and the balance in store at the close of the year w 11,591⅛ lbs. Compared with last year there was a falling off in th issues of 1,706⅝ lbs. which was chiefly due to a reduction in th amount required for Bombay from 2,400 lbs. to 1,640 lbs. and to th fact that no quinine was sent to the Medical Stores, Punjab. Th question of the distribution between the Bengal and Madras fa tories of the business of supplying quinine to the various Loc Governments and administrations was decided in the Governme of India letter No. 3-34-16 of 9th January 1899. The Nedivatta factory will supply quinine to Madras, Bombay, North-West Pro inces and Oudh, Central Provinces, Burma, Ajmere, Coorg, Ber and Mysore, while the Bengal factory will supply Beng Punjab and Assam. An increased demand is therefore expecte during 1899-1900 and there is an ample stock of quinine o hand to meet all indents.

Febrifuge.—At the end of last year the stock on hand was 5,66[illegible] The quantity manufactured was 7,238, making a total of 12,89[illegible] The quantity issued was 1,623½ and there remained a stock in ha of 11,274½ lbs.

The present stock of febrifuge is so large, and the prospect disposing of it rapidly in this country is so small that it is sugges ed that some use might be found for the alkaloids in the Briti Possessions in Africa and in Egypt.

IX. MISCELLANEOUS.—(*a*) *Issue of quinine packets to Collectors.*—During the year 610 packets, each containing 102 5-grain powder were issued to Collectors for sale and the amount realized by th sale of powders by the Revenue officials was Rs. 789-12-7.

(*b*) *Sale of quinine at Post offices.*—It is to be regretted that falling off has occurred in the sale of quinine at the Post offi Before the price of each powder was raised, the sales were increa

ing steadily, but the raising of the price from 2 pies to 3 pies per 5-grain powder has undoubtedly checked the sales. The number of packets sold during the year under review was 4,766·14 against 8,605 in the preceding year. 279·48 packets were sent out as permanent advances, that is, as stock to be held at newly-opened offices making the numbers of packets issued 5,045·62 against 9,030 in 1897-98. A special report on this subject will be submitted to Government on the 1st September, but it may be mentioned here that since the close of the year there has been a very decided improvement in the sales.

THE PROPOSED COFFEE ASSOCIATION.

A SCHEME FOR DIRECT SUPPLY.

Mr. John Samson, Joint Editor and Director, *South American Journal*, writes :—

As I find that many coffee planters in your district, as well as in the Federated Malay States and in the Dutch East Indies, are manifesting a great interest in the movement I initiated recently for the organisation of an association of producers of coffee, with the object of stimulating the consumption of the article and generally to protect the interests of those engaged in the industry. I beg that you will grant me space in your columns to reply to the numerous correspondents who have addressed me on the subject. I will thus be enabled to give fuller particulars with regard to the objects and progress of the association. I should explain that I was led to take up this matter in the first instance, in view of the heavy losses which are being sustained by the producers in Brazil and Central America, with which countries my paper, the *South American Journal*, has been for so many years associated. Consequently the final programme of the association have only been published in the prospectus in the Spanish and Portuguese languages. These are now being largely circulated in the countries mentioned. The Government of Brazil has manifested a great interest in the scheme and has asked me to supply a large number of pamphlets to be distributed officially. The consuls of the coffee-producing countries of Central America and of Mexico have also sent out quantities of pamphlets to their Governments, and many merchants in London, Hamburg, Havre and elsewhere, have sent copies to their correspondents. I send you herewith specimen copies.

It is obvious, however, that the success of the proposed association will be more assured if the coffee growers throughout the world should take part in it.

The Editor of the *Indische Mercuur*, of Amsterdam, has kindly offered his co-operation in bringing this matter before his countrymen in Java, Sumatra, etc., where about sixty of the leading planters have already intimated their approval of the scheme.

Probably this letter may lead to the planters in Ceylon, &c., taking some definite action in the matter.

As explained in the Spanish prospectus, the original idea was to form an association principally for propaganda purposes, to impress upon the public the peculiar merits of coffee and to instruct them how to prepare it. It was suggested that this institution should be supported by a small levy, voluntarily, or legally, imposed upon each bag of coffee exported.

Upon going into the matter more closely, however, I soon perceived that this plan was encumbered by so many practical difficulties that to carry it out to a satisfactory issue would be almost impossible. These I have alluded to at length in my pamphlet. Amongst them I may mention the delay which would necessarily have to take place before all the coffee-producing countries of the world could be got to agree to the assessment; the impracticability of arriving at a general agreement as to its amount, the difficulty of its collection and of being able to estimate in advance the amount of revenue likely to be derived from it; the danger of official interference in the management, and many others, which will immediately occur to business men.

It became evident that the association could only succeed if founded upon a commercial basis.

Fortunately it will be easy to do this under the conditions which now exist, and are likely to prevail for some long time to come in the coffee markets of the world. It is well known that the retail prices have not yet fallen in any degree proportionate to those which rule in wholesale quotations; also that coffee is sold largely adulterated in most European countries. From these circumstances it results that there is a splendid profit to be made by any association, or company, which will take up the business of coffee-roasting on scientific principles upon a large scale, whilst by the issue of coffee, guaranteed pure, at moderate prices, all adulterations could be driven from the market, whereby consumption of coffee will be greatly increased. I have gone carefully into this matter, and have made elaborate calculations as to the profits, which are most alluring. My estimates have been verified by people who have had great experience, and it is probable that, whether the planters give their support or not, there will soon be several large roasting factories established in England, using the machinery which I have discovered to be the best. as by it a great saving is made in the process.

It will be much better, however, if these factories are owned and controlled by an association of producers. If started by commercial speculators, the interest of the proprietors will be to keep the wholesale prices of coffee as low as possible, whereas the producers, having a wider view, could devote some of the profits to propaganda, which would ultimately lead to a more general consumption of coffee.

If I find that there is a real interest taken in this business, I shall have much pleasure in publishing the full detailed prospectus in English. The plan at present is to form a company with a capital of £60,000 in shares of £1 each.

There is another important function, which an association of coffee-producers could perform to the great advantage of its shareholders, namely, that of acting as their commercial agent; as the consignee of their coffee and the supplier of their stores, I have perceived this ever since I arrived at the conclusion as to the best plan of organising the company; but I have not sought to emphasise the point as I hoped and desired that I would have the support of merchants on this side in my efforts for its promotion. As, however, these gentlemen have now shown themselves to be either apathetic or covertly hostile to the scheme, there is now no object in keeping it dark, especially in a letter addressed to planters. Many of your readers must know from experience that their European correspondents do not always take the pains they ought in order to secure the best prices for produce consigned to them. In too many cases it is simply handed over to a broker to be "slaughtered," at any price it will fetch. A co-operative association of planters, however, formed upon the lines I have set forth, would have its own large body of consumers which it would reach directly, and many intermediate commissions and expense would be saved. Besides this, all the profits now derived by merchants from sale commissions or purchase of supplies would come into the treasury of the association and back into the pockets of the planters themselves in the shape of dividends. I hope the considerations I have mentioned will be sufficient to lead the planters of your district to take an active interest in the scheme.

RUBBER—ARTIFICIAL AND NATURAL.

Artificial Production of India-Rubber.—The artificial production of india-rubber has long been a fascinating problem for chemists. Dr. Tilden has how succeeded in producing it in small quantities, although its commercial production does not at present seem very near realisation. A hydrocarbon known as isoprene was discovered years ago by Greville Williams amongst the products of the destructive distillation of india-rubber, and in 1884 Dr. Tilden obtained it by the action of moderate heat on turpentine. Some isoprene, which was made by Dr. Tilden in the course of his researches in terpenes, was preserved, and on examining these he was surprised to find the contents of the bottles completely changed, and in place of a limpid, colorless liquid the bottles contained a dense syrup, in which floated several large masses of a yellowish solid. This, on examination, turned out to be india-rubber, exhibiting all the characteristic reactions of that body with solvents and also its power of combining with sulphur to form a tough elastic body. The change from isoprene to india-rubber is extremely slow, taking several years to complete, and so far, Dr. Tilden says that although he has tried everything he can think of, all attempts to hasten the action have resulted in the production of a body known as colophene, a thick sticky oil, quite useless for all purposes to which india-rubber is applied.

Rubber of the Soudan.—Whilst on the subject of rubber, it is of interest to learn from the recently-issued report of Sir William Garstin on the subject of the Soudan, that on the White Nile, in

the Bongo and Rohl districts, the india-rubber creeper (Landolphia florida) is found in great profusion, which, as is pointed out, should be an important asset in the future trade of the Soudan, although, of course, the rubber produced from this plant is not of such good quality as that from Para or Assam. We are accustomed to look upon the Soudan as anything but a source of wealth to its holders, but from this report of Sir William Garstin's to the Foreign Office it would appear that there are great potentialities of wealth in the district, and there is urgent need of a scientific examination of the country with a view to the development of its natural resources. The vast forests which line the banks of the Upper Blue Nile, and extend as far as the Abyssinian frontier and those of the provine of Bahr-el-Ghazel, should prove sources of future wealth. In regard to the mineral wealth of the district, very little appears to be known. Iron ore is found in the Bahr-el-Ghazel province and also at Darfur, and gold mines were at one time worked in the mountains south of Fazogl. At present coal does not seem to have been discovered.—*Daily Chronicle*, September 8th.

LONDON CHARGES OF TEA COMPANIES.

III.

Having demonstrated that the warehouse charges for working tea were unduly high, and that the maintenance of these charges was enforced, or endeavoured to be enforced, by the organisation known as the Tea Clearing House, we now proceed to give some particulars of the constitution of that body. No one will complain about its ostensible aims which are to give facilities to the wholesale trade in tea by providing a central office where all warrants and delivery orders may be lodged, instead of at the various docks and warehouses, thus avoiding any necessity for the personal attendance of clerks and others at the offices of the various docks, warehouses, wharves, &c. In this respect it forms a most useful organisation, and all practical people connected with the tea trade would be sorry to see its scope limited But from the very start we should imagine that its founders had in view the maintenance of warehouse charges. Created about midsummer, 1888, its formation followed upon the long struggle between the docks and wharfingers, during which warehouse rates on tea, like other warehouse charges, had been cut to points that were positively unremunerative. Discounts of 50 and 60 per cent. were then not at all unusual, and it is only fair to say that importers of tea do not desire to see that state of things return, as, like all sensible men, they recognise that poor pay leads to bad work. And in fixing the present tariff with a discount of 10 per cent. defenders of the Tea Clearing House may urge that it was justified by the conditions of the time. We have grave doubts upon this point, but, however that may be, conditions have certainly changed since, for whereas in 1888 the Indian tea crop amounted to about 99,000,000 lbs., and the average price obtained to 10¾d. per lb, in the past year the crop exceeded 150,000,000 lbs., and the average price had declined to 8¾d. per lb. With larger quantities to handle, and importers working upon a much lower margin of profit, the 1888 tariff of the Tea Clearing House has become antiquated, and, as we have said, many of the warehouse keepers would be quite prepared for a reduction in charges.

To outsiders like ourselves, nothing might appear easier than to bring pressure to bear upon this central body. The members of the Tea Company House consist of the following docks, wharves, and warehouses:—

PRIVATELY OWNED.	OWNED BY COMPANIES.	
Brook's Wharf.	Cutler-street Warehouse.	London and India Docks.
Buchanan's Warehouse.	Commercial-road Warehouse.	
Cooper's-row Warehouse and Brewer's Quay.	St Katharine Dock Warehouses.	
Fresh Wharf.	Butler's Wharf.	
Hay's Wharf.	Chamberlain's Wharf.	
London and Continental Wharf.	Colonial Wharf.	
Nicholson's Wharf.	Metropolitan Warehouse.	
Oliver's Wharf.	Monastery Warehouse and Abbey Wharf.	
Red Lion and Three Cranes Wharf.	Monument Warehouse.	
Smith's wharf.	Priory Warehouse.	
Trinity and St. Olave's Warehouse.		

Rudimentary as our knowledge of the tea trade is, we have been able to gather that a large interest in these warehouses wharves is held by those directly interested in tea. Informat about the privately-owned concerns is, of course, difficult to obta but we believe that Buchanan's Warehouse and Oliver's Wharf owned by Messrs. P. R. Buchanan & Co., which means that John Muir has a large share in their management. Then we also led to understand that the respected firm of W. J. & Thompson have a strong interest in the Trinity and St. Olav Warehouses, and we understand that tea importers have intere in other of these privately-owned concerns. Turning to the joi stock properties, those owned by the London and India Do Committee would probably be unaffected by this influence, as warehousing of tea forms but a small proportion of their busine Butler's Wharf, however, stands on a very different footing, for operations are wholly devoted to tea. The company, in fact, is outcome of an organised attempt to reduce warehouse charg Somewhere about 1892 tea importers felt the onerous character these charges, and a number of the leading companies and age firms bought up Butler's Wharf and formed it into a moderat capitalised company which has paid exceedingly good dividen ranging from 70 to 80 per cent In doing this, although an portant section of the tea importers were included in the effort was found that the Tea Clearing House, with its prohibition subscribers dealing with warehouses outside its members, too strong for the new company, and it had to enter the "rin and make its charges correspond with those of others in the sa business. The capital of the concern is £20,550 in shares of each, of which only £5 per share has been paid up; and four-fif of the shares are in the following names:—

	No of Shares.		No. Sha
Darjeeling Company	... 200	Surgeon-Gen. de Renzy	..
Jorehaut ,,	... 300	H. Earnshaw ...	..
Doom Dooma ,,	... 50	H. Lafone ...	..
Jokai ,,	.. 325	A. M. Lafone ..	
Central of Ceylon Company	.. 50	E. Wahab ..	
R. G. Shaw ...	... 250	J. F. McGuire	..
R. B. Mayor ...	... 100	C. E. Buckingyoung	...
F. A. Roberts ...	... 300	J. Young ..	..
R. Lyell ...	... 100	J. Brooks ..	...
G. Williamson ...	... 200	R. J. Boyle ..	...
G. G. Anderson ...	... 100		

Thus only five tea-producing companies hold shares in the und taking directly, so that the major part of the high profits earn by this company go into the pockets of private individu Excepting the two Messrs. Lafone, who were probably the origi wharfingers, the other large shareholders are wholly gentlem connected with the tea trade, either as directors of tea compan or members of agency firms. As a co-operative company, owned a few companies and a number of individuals, it has been a gre success, but it has altogether failed to improve the position of t tea trade. Amongst the other companies we find that the lar importing house of Barlow & Co. practically owns the Monaste Bonded Warehouse and Abbey Wharf, and that the old-establish firm of Rucker Marshall & Co., formerly Rothwell, Marshall & C are virtually the owners of the Monument Bonded Warehous Finally, we have a rather curious instance of small interests of importers in the case of Chamberlain's Wharf, the shareholders which are as follow:—

	No. of Shares.		No Sh
C. R. Besley ...	... } 77	E. G. Goulder	..
E. Besley ...	... }	Sir W. Johnston	
M. B. Peacock ...	... }	C. P. Jones	
E. Besley ...	... 77	W. M. Leake	...
R. A. Bosanquet ...	... 1	J. L. Shand	...
A. T. Brooke ...	... 1	Anglo-Ceylon and Estates	
W. Figg ...	... 1	Company ...	

The capital of this company is only £1,630 in shares of £10 ea and the first three holdings represent executors of the late A C. R Besley. The holdings of one share each have gradually gro up of late years, and the holders are all connected with the trade in one way or another.

Contrary to the view of outsiders, those who are taking an act part in the agitation for a reduction in Warehouse charges consi that the large interest in Warehouse and wharfage property h by prominent members of the tea trade is a source of weakness

the trade as a whole. It is argued that it divides the trade into two classes—those who benefit by the paying of high Warehouse charges, and those who suffer by them.

At this stage of the controversy we can hardly agree with this doctrine, for, after all, it is better to deal with those who know the difficulties and troubles of a trade than with strangers. Even tea-brokers, who are not interested directly in prices, have a strong motive to seek a reduction of charges in the fact that the present heavy levies, coupled with higher freight rates, prevent tea coming to London, and are leading to the Colombo and Calcutta markets having the entire handling of much of the tea sold to countries outside the United Kingdom. If Sir John Muir, Messrs. Buchanan & Co., Barlow & Co., George Williamson & Co., Alexander Lawrie & Co., and other important firms and personages, are imbued with that strong desire to improve the position of tea companies which was evinced in their proceedings over the "draft" question, they should recognise at once that the smoothing away of these Warehouse difficulty is easily within their powers. By a decided stand on the part of those owners of warehouses and wharves who are interested in tea, we believe that at least seven out of the twenty-one warehouses in the Tea Clearing House could declare their independence of its arbitrary tariff, and these warehouses are precisely those which have the handling of the greatest quantity of tea. Against a threat to do this the other members would probably be powerless to act effectively, and the moderate reduction in charges asked for by the trade might be attained in a proper manner without friction. Shareholders in, and directors of, tea companies, together with owners of plantations, know, therefore, where they should turn for assistance in this matter, and by judicious ventilation of the subject at meetings of the Indian Tea Association and the Ceylon Association in London, and by those committees so beloved by the trade that have sprung from these associations, much could, we feel sure, be done to bring about a better state of things. Otherwise, we shall be much inclined to consider that the passionate action of the tea importers as a whole over the "draft" question did not arise out of very elevated motives, and that individual interests are allowed to override the interests of the trade as a whole.—*Investors' Review.*

CACAO SOILS IN THE WEST INDIES.

Mr. J. B. Harrison, Government Analyst, British Guiana, wrote on 31st August last to the *Ceylon Observer*:—

My attention has been directed to an article in your issue of July 18th, 1899, in which Mr. Cochran has ascribed work done in this laboratory by myself and staff to Professor Carmody, of Trinidad. I shall be obliged to you if you will give to Mr. Cochran the two pamphlets I have sent under cover to you, the first entitled "The rocks and soils of Grenada" and "The agricultural chemistry of cacao" and the second an extract from a report on the agricultural work in the Botanic Gardens of this colony relating to cacao. I may remark that the Grenada soils were personally selected by myself from the plantations.

I have also a series of analyses of the very fertile cacao and coffee soils of Surinam, which I made for the purposes of comparison with the soils of the interior of the Colony, which, if they are of any interest to you or to Mr. Cochran, I shall be happy to place at your disposal.

Professor Carmody's analysis are not comparable with ours, as he uses a different method of attacking the soil with acid solvents. We have for the last fifteen years used invariably the process described in one of the pamphlets.

I may say that my experience in the West Indies points to the great importance of the amount of potash in an available state present in the soil and to the lesser importance of phosphoric and nitrogen and this consideration is based on the analyses of sixty or seventy different soils.

The *Observer* also publishes Mr. Cochran's remarks as follows:—

City Analyst's Office, Colombo, October 21.

I have to thank you for a reading of the letter of Mr. J. B. Harrison, Government Analyst of British Guiana, on the subject of the cacao soil analyses, with which I dealt in the article you published on 20th July of the present year. I am also much obliged for the two pamphlets he has sent to me, embodying the results of his analytical work of many years.

They represent an amount of original and careful analytical work which only an analyst can fully appreciate. I should also very much wish to see his analyses of the very fertile cacao and coffee soils of Surinam, which Mr. Harrison offers to place at your disposal.

Of the two sets of cacao soil anlyses which I compared last July, only the second set, viz., the analyses of soils, of average fertility, was conducted under the supervision of Professor Carmody, Government Analyst of Trinidad; while the first set, the analyses of fertile cacao soils, was the work of Mr. J. B. Harrison, and his staff at British Guiana. I am sorry I did not know that Mr. Harrison was the analyst till I received his letter which you have forwarded. The copy of the proceedings of the Agricultural Society, in which I first saw the analyses (published in 1897) was incomplete, some pages being a-wanting, and amongst them the first page of Mr. Harrison's report; but even in the complete form which he now sends me, entitled "Extracts from the Report on agricultural work in the Botanic Gardens relating to cacao" and printed by authority of the Government, neither Mr. Harrison's name nor that that of any other member of the staff of the Botanical Gardens occurs!

As the two sets of analyses were by different chemists, using different analytical methods, they are of course not so strictly comparable, as if the same analytical methods had been followed, but a comparison is still instructive.

As Mr. Harrison has had great experience in the analyses of cacao soils, planters will be glad to have the latest word he has to say on the subjects which is as follows:—"I may say that my experience in the West Indies points to the great importance of the amount of potash in an available state present in the soil, and to the lesser importance of phosphoric acid and nitrogen, and this consideration is based on the analyses of sixty or seventy different soils."

I find the same view as regards nitrogen more fully expressed in Mr. Harrison's work entitled: "The rocks and soils of Grenada and Carriacow and the agricultural chemistry of cacao," where he remarks:—"Upon all the soils of Granada, light dressings of nitrate of soda or sulphate of ammonia will prove beneficial to plants and upon the soils which appear in the list marked 'nitrogen' such dressings are, in my opinion, essential to successful cultivation." (These last are soils in which the amount of nitrogen ranges from ·032 to ·137 per cent.). "Where such crops as cacao, coffee, and nutmegs are the staples, it is necessary to use great care with regard to nitrogenous manures. Heavy dressings of active nitrogenous manures may easily cause excessive leaf formation.

COFFEE CULTIVATION IN INDIA.

MR. J. E. O'CONOR'S REPORT.

The Report of the Director-General of Statistics on "The Cultivation of Coffee in India" has been issued. Two tables appended to it state the facts regarding the cultivation of coffee, the first in detail for the two years 1897 and 1898, the second in abstract for the fourteen years 1885 to 1898. Mr. O'Conor remarks:—"It should be noted, however, that the figures, for which the Government are dependent upon the planting community, are imperfect and defective, planters, for unknown reasons, sometimes withholding information."

Following is the Report itself:—

AREA.

At the end of 1898 there were 281,570 acres of land under coffee in India, all, with the exception of 549 acres, in Southern India. The cultivation of coffee is in fact restricted for the most part to a limited zone in Mysore, Coorg, and the Madras Districts of Malabar

and the Nilgiris. About 45 per cent. of the coffee-bearing area is in Mysore, where there were 128,079 acres in 1898, and the plant is grown on 128,410 acres, forming another 45 per cent. in the British Districts of Coorg (82,575 acres), the Nilgiris, and Malabar (45,835). If to these two areas are added 6,384 acres in Travancore and Cochin, we find 93 per cent. of Indian coffee concentrated in the elevated region above the South-western Coast. Mysore, Coorg, and the Madras Districts contain 97 per cent. of the coffee-growing area.

In the Madras Presidency cultivation on an extended scale is practically restricted to the two Districts already mentioned and to Salem and Madura. The only other Province in which coffee is grown, except experimentally or to an insignificant extent, is Burma, and the cultivation there, mostly in Toungoo, is very limited.

The area in Madras, after a reported contraction in 1896 and 1897, again expanded in 1898 to the level of 1894 and 1895. In Coorg the area reported in each of the last three years is much beyond the average, but in Mysore it has been reduced approximately to the level of 1892.

PRODUCTION.

The yield in 1898 was about 23¾ million pounds, that of 1897 having just exceeded 24 millions, the production in both years having been extremely poor, following a poor yield in 1896. The poverty of the crop in 1896 and 1897 was due in the main to adverse seasons in Mysore, Coorg, and Travancore, and in all three cases there was a recovery in 1898, which was, however, incomplete in the case of Mysore; but, to set against this recovery, the Madras crop was a signal failure. Since 1897 the fall in prices has removed the stimulus which had been given for a few years to the further expansion of the coffee-growing area, and disease has combined with adverse climatic conditions to reduce the yield.

Taking 100 to represent the area and production in 1885, the ratio of yearly increase or decrease is as follows:—

	Area.	Prodn.		Area.	Prodn.
1885 ..	100	100	1892 ...	110	97
1886 ...	97	90	1893 ...	109	109
1887 ...	103	109	1894 ...	117	101
1888 ...	104	76	1895 ...	119	115
1889 .	110	85	1896 ...	121	75
1890 ...	114	63	1897 ...	116	69
1891 ...	111	113	1898 ...	118	68

PERSONS EMPLOYED.

According to the statements there were, in 1898, 25,930 persons permanently, and 88,550 temporarily, employed on the coffee estates, making a total of 114,480 persons, which is equal to one person, to 246 acres.

EXPORTS AND CONSUMPTION.

The following figures are the average of the five years ending 1898-99:—

		Lbs.
Indian coffee	Production	29,849,357
	Exports	28,628,514
	Left in India	1,220,813
Foreign coffee	Imports	1,564,416
	Re-Exports	1,025.225
	Left in India	539,191

About 96 per cent. of the production is exported, and the coffee consumed in India consists of Indian and imported coffee in the proportion of 69 per cent. of Indian to 31 per cent. of foreign coffee. The explanation of the fact that such a large proportion of foreign coffee, mostly imported from the Straits, is consumed in India doubtless lies in the disinclination of the planters of Southern India to take any account of the local market.

The principal countries to which were shipped the 30,246,272 lbs. of Indian coffee exported in 1898-99 were—

United Kingdom	17,392,480
France	9,356,816
Austria-Hungary	1,023,568
Germany	618,688
Ceylon	505.680
Australia	265.440
Arabia	229,488
Asiatic Turkey and Persia	131,264

PRICES.

Coffee is not sold, as tea is sold, before shipment for export, therefore there is no Indian quotation of price. The average pri in London for East India plantation coffee in each of the twenty-five years are here subjoined with their variations, tak the price of 1874 as the datum=100:—

	Per Cwt. s.	d.	Variation.		Per Cwt. s.	d.	Variati

TEA.

CHINA.—Rather easier prices obtain for Scented Caper, but other makes are about steady. During the week 3,348 packages have been offered at auction, mostly selling as under:—New make Congou $5\frac{3}{4}$d, Scented Caper 6d to $7\frac{1}{2}$d, Ouchaine 6d to $6\frac{3}{4}$d, Lapseng Souchong $6\frac{1}{2}$d to $7\frac{1}{4}$d, Oolong 5d to $5\frac{1}{4}$d; Green, Gunpowder $9\frac{1}{2}$d to $10\frac{1}{4}$d, Young Hyson $6\frac{3}{4}$d to 1s $2\frac{1}{4}$d, Hyson $4\frac{3}{4}$d to 1s $0\frac{1}{2}$d per lb

INDIAN.—Rather more was brought to the hammer, viz, 48,500 packages, compared with 45,600 packages last week and 48,900 packages a year ago.

Although the satistical position is favourable a quieter tone prevailed, due it is said to the stringency of the money market, and also to less support from the country. Supplies therefore proved somewhat in excess of requirements and prices "sagged" a little for all except choice liquoring parcels, which held their own. Common to fair Pekoe Souchongs and Pekoes in most instances mark a decline of $\frac{1}{4}$d per lb. for the fortnight while, inferior Broken Pekoes passed in favour of buyers. Medium Pekoes, especially when lacking fulness in cup were occasionally neglected so that at times lower rates had to be accepted to effect sales. About 1,200 packages from South India mainly of useful quality were included in the catalogues and met with attention.

Duty paments continue on a very satisfactory scale, and it is encouraging to note, as will be seen by the figures given below, that the exports of British grown Tea from London during September amounted to about $\frac{1}{2}$ million lbs., this being the largest total yet recorded for one month.

For 39,100 packages on Estate Account $8\frac{5}{8}$d per lb. was realised, contrasted with $8\frac{3}{8}$d per lb. for 37,700 packages, and 9d per lb. for 38,000 packages in the two preceding seasons.

CEYLON.—Public sales were about on a par with those of last week, viz.:—29,400 packages versus 30,300 packages: while at this period in the foregoing year, the quantity was only 12,900 packages

Competition was less keen and quotations for most descriptions showed some irregularity, leading in many cases to a shrinkage in value. Ordinary Pekoe Souchongs were more readily to be had at 6¼d per lb., while Pekoes and Broken Pekoes over 6¾d per lb., unless with good flavour, dropped ¼d to ½d per lb. Fine and finest with stand-ont infusions, maintained their position, but when deficient in this respect, they went against sellers.

Partly on account of the smaller proportion of desirable invoices offered, the average has fallen to 8d per lb. On the 5th instant it was 8¾d per lb., and 8¾d per lb. in 1898.

JAVA.—Nearly 2,300 packages of direct import were submitted which in sympathy with other growths were slightly easier. At present nothing further is advertised.

Deliveries—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, viz.:—

	Lbs.
From 1st to 10th Oct., 1899	6,795,727
Do. do. 1898	5,524,247

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	41,222	7,296	48,518
Ceylon ...	24,964	4,388	29,352
Java	1,844	413	2,257
Total ..	68,030	12,097	80,127

Also 114 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 13th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1899-1900	509,723	440,768	23,757
1898-1899	482,329	461,519	18,649

48,508 *pkgs.* INDIAN
29,619 „ CEYLON
2,289 „ JAVA
} Total 80,466 packages were offered in public auction this week.

The consumption of Tea in the United Kingdom continues to increase, duty payments for the past nine months being five million pounds over the corresponding period of last year, notwithstanding the rise in value of low priced Teas. The re-export from this country of both Indian and Ceylon growths also shows a slight increase.

Stock of all Tea in United Kingdom on 30th September.—1899' 84,128,000 lbs. 1898, 77,160,000 lbs. 1897, 78,934,000 lbs.

INDIAN.—The quieter feeling noticed last week has become more apparent Competition for all but the finest grades was less animated. medium Teas occasionally showing a slight decline in price; finer grades continue to realise good prices. The late floods in Darjeeling do not appear to have done as much damage as at first believed.

Although arrivals of Indian Tea since 1st June are 5,000,000 in excess of last year, the stock in London is below that September of last year. The following averages are worth note:—"Poobong," 1/9¼; "Risheehot," 1/4½; "Oaklands," 1 "Ass. Fron. T Co. Hok," 1/2¼; "Budla Beta T Co. K.," 1/2

Week's av. of Tea sold on Garden Account 1899—39,485 pk av. 8·58d. 1898, 37,815 pkgs., av. 8·29d.

Total Tea sold on Garden Account 1st June to date 1899—352 pks., av. 8 57d. 1898—342,682 pkgs.. av. 8·84d.

CEYLON.—The auction was again heavy, comprising 29,619 p ages against 30,637 packages last week, and 27,680 the week bef these heavy auctions being caused by the recent accumulatio Tea; this is now pretty nearly disposed of, and it seems likely the sales will become gradually smaller. The continued press has placed a very heavy strain upon the market, and prices week again showed its effect, being slightly lower, especially medium Teas, many of which must be quoted ½d. to ¾d. per cheaper. For Teas for price bidding was strong, and quotati fully maintained, while good liquoring and fine Teas were wanted. The followidg average may be mentioned:—"Talawak T Es. T." 7/0¼. Average for week 7·93d against 8·67d. in 1898.

Ceylon Tea sold on Garden Account 1st January to date 189 842,932 pkgs., av. 7·96d. 1898 899,168 pkgs., av. 7·67d.

JAVA.—Not much change was noticeable in this growth, tendency being if anything slightly easier. 8,853 packages are be offered in Holland on the 26th instant.

IN CANADA.

Wholesalers are experiencing a continued increase in the dema for teas, and a good business is now being done. The brokers rep that they are experiencing a good demand for teas of Indian Ceylon growth under 15c. per lb. Business is limited on acco of the smallness of supplies on spot. Very little is being do from London, as importers prefer to wait until teas are on spot.

COCOA.

Auctions on the 10th instant presented 3,316 bags, which me fair enquiry at generally better prices except for African, wh was lower. Of 413 bags Trinidad catalogued 190 bags sold—fai fine red at 71s to 75s 6d, or 1s to 2s over valuations. 653 b Grenada offered and half sold at full rates—64s to 65s for good fine red, and 60s for common. 65 bags Jamaica mostly sold at improvement of 1s per cwt.—at 59s to 60s for common. 4 b St. Lucia realised 59s 6d. 10 bags Dominica retired. Of 69 b Surinam only a lot or two sold at 61s. Of 133 bags Puerto Cabe only 3 bags sea-damaged sold at 89s 6d. Of 901 bags Guayaq 80 bags sold at 66s for Carapuez. 381 bags African found buy at 59s 6d to 62s for good to fine, showing a depreciation of 1s. bags Seychelles sold—fine Ceylon cure at 73s 6d, common 60s to 6 Ceylon quiet but steady; 664 bags offered and 95s bags sold—g to fine bold red 80s 6d to 84s 6d, good to fine small 58s 6d to 66s pickings 53s, black 43s per cwt.

PEPPER.

BLACK.—The market is firm and a considerable business has been done, sales including 100 tons Singapore on the spot at 5½d for fair For arrival value has declined and about 200 tons are reported sold at 5½d to 5 9/16d for near at hand, at 5 17/32d to 5 9/16d September-November at 5 11/16d October-December at 5 11/16d for January-March, and at 5¾d to 5 13/16d February-April. The tone at the close is firm and 25 tons March delivery sold at 5¾d, being dearer.

At auction on the 11th instant 100 bags Penang bought in at 5⅝d; 7 bags fair small Tellicherry sold at 5⅝d per lb.

WHITE.—is quiet, with business in fair Singapore on the spot at 3¾d, and fair Penang at 8 7/16d to 8½d per lb. For arrival no sales reported.

At public sale on Wednesday 74 bags 5 cases Singapore offered—fine at 9½d. 31 bags Siam retired at 8⅝d per lb., and 67 bags Penang at same price.

GINGER.

COCHIN.—Offerings were large—303 cases 1,104 bags—but there was only a desultory enquiry, not more than 170 packages selling in the room at barely valuations. Bold, with a little medium coughly cut and scraped, realised 76s to 76s 6d, medium ditto 52s 6d to 53s, dull small and ends partly limed 25s, good pickings 17s to 17s 6d, common ditto 15s. Calicut rough Sorts, rather lean and partly mouldy, 23s, bright medium and small ditto 22s 6d, small ditto 21s to 21s 6d per cwt.

JAMAICA.—40 barrels sold at about late rates—low middling 60s to 61s 6d, common 54s to 56s 6d per cwt.

CARDAMOMS.

The moderate supply offered to-day was well competed for, and practically everything was sold at about 3d to 4d per lb. dearer rates, the following being among those paid:—Ceylon-Mysore, good to fine bold pale, 3s 7d to 4s 3d per lb.; good medium ditto, 2s 11d to 3s 5d; small pale, 2s to 2s 10d; very small pale, 1s 8d to 2s; medium long pale, 2s 6d to 2s 10d; medium specky, 1s 8d to 2s; splits, 1s 6d to 2s; dull brown long medium and small, 1s 10d (4 cases); brown pickings, 1s 7d to 1s 9d; seeds, from 1s 9d to 2s 6d, according to quality. Ceylon-Malabar, fair brown, 2s, and lean, 1s 9d; very small brown, 1s 5d; splits. 1s 2d per lb. Tellicherry, very leanish brown, sold at 1s 7d to 1s 8d per lb. without reserve.

CINCHONA.

The *Chemist & Druggist report*:—In auction on Tuesday there was a good demand for the small supplies catalogued, and the bulk was sold at prices showing a recovery on the recent decline in Amsterdam, the unit value being 1d to 1⅛d per lb.

The offerings were as under—

	Packages offered.		
Java cinchona	279,	of which 279	were sold.
East India cinchona	226	,, 176	,,
Cuprea bark	202	,, 156	,,
Bolivian Calisaya cinchona	165	,, 165	,,
Ceylon cinchona	59	,, 26	,,
Other kinds (damaged)	44	,, 44	,,
	975	846	

The following were the approximate quantities purchased by the principal buyers:—

	Lbs.
American and Italian factories	77,238
Mannheim and Amsterdam factories	21,090
Imperial quinine-factory	20,100
Messrs. Howards & Sons	16,800
Brunswick factory	3,135
Druggists, &c.	8,650
Total quantity sold ...	147,013
Bought in or withdrawn ...	14,178
Total quantity offered ...	161,191

The following were the prices paid:—

SOUTH AMERICAN.—Cuprea, new import, 1⅝d to 1¾d per lb.; Bolivian, cultivated Calisaya quill, 6d to 6¾d; very rich, 7¼d to 7⅝d per lb; Colombian, damaged, sold with all faults.

CEYLON.—Succirubra, fair red chips, 3⅛d to 3½d; Ledgeriana ditto 4⅝d per lb.

JAVA.—Ledgeriana stem chips, &c., poor, 1⅛d to 1¼d; fair 3d; to 3½d; and good. 4⅝d to 5⅜d.

EAST INDIAN.—Crown branch, 1¼d to 2d; chips, 2⅞d to 3¾d; good 4¼d; Ledgeriana, &c., chips, 2⅞d to 3⅜d per lb.

The shipments from Ceylon for the week ending September 19 have been 9,726 lbs; and the total exports from January 1 to September 19 were—

	1899.	1898.	1897.	1896.
Lbs.	493,416	723,482	526,093	881,743

The cinchona-auctions to be held in Amsterdam on November 2 will consist of 4,510 bales Ledgeriana, 368 cases Hybrid, and 678 packages Succirubra. The stock in first-hand at Amsterdam on October 10 consisted of 2,350 packages Government and 8,059 packages private bark, including the quantity to be offered in auction. In the drug-auctions good thin Huanoco sound quill brought 6¾d to 7¾d per lb., and Loxa quill 9¾d to 10d for sound and 6¾d for first class water-damaged. Eight bags of New Granadian from Savanilla brought 2d per lb., subject. Twenty bales of flat Cartagena were bought in at 6d per lb.

CINCHONA.—Only 975 packages were brought to the hammer at the monthly sales on Tuesday, which small supply met good competition and nearly all sold at the rates ruling at the last auctions, or rather above the prices paid at the Amsterdam sales a fortnight ago. The unit value is 1⅛d, contrasted with ⅞d this time last year.

411 packages *South American* offered and 370 sold—Bolivian cultivated Calisaya quill 6d to 7⅝d, Cuprea 1⅝d to 1¾d, and Colombian 1⅜d per lb.

62 packages *Ceylon Cinchona* half sold—Succirubra chips 3⅛d to 3½d, Ledgeriana chips 4⅝d per lb.

226 packages *East India Cinchona* catalogued and 180 bales sold—Officinails, chips and shavings 2¾d to 3¾d ditto renewed 4d to 4¼d, branch 1¼d to 2⅞d; Red, chips 2¾d to 3⅛d, silvery quill 4d; Ledgeriana, chips 3⅝d; Hybrid, chips 2d per lb.

Java Cinchona sold—Ledgeriana, chips 3½d to 5¼d, twigs 1⅛d to 1¼d, root 5⅛d; Hybrid, chips 4⅝d to 5⅜d per per lb.

QUININE.

The market closed last week with a good business at 11⅛d per oz. spot, and December at 11d in second-hand, but on Monday a firmer tendency set in December delivery being quoted at 11¼d, at which a small business was done, buyers offering 11⅜d, but no sellers. Since then business has been on a small scale, Zimmer and Amsterdam brands selling at 11d on Wednesday, and B & S or Burnswick, quoted at 11⅛d for December delivery, which figure is now on a level with German makers' quotation. To-day makers advanced their quotations to 1s per oz. for 1,000-oz. lots, and in second hands business has been done at 11¾d for December delivery; but there are no eager sellers, and later in the day there was practically no second-hand market.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," Agra Bank Buildings, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 17th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

THE FOREST PRODUCTS OF TRAVANCORE.

We are very pleased to see that the Travancore Government is alive to the necessity of marching with the times in respect to Forest Products. The Administration Report of the Travancore State for the Malabar year 1073 (1897-98) contains many allusions to defects or deficiencies that have been noticed, and to progressive measures actually introduced or recommended. In these remarks there is a good deal that would apply equally well to other parts of Southern India, though it has always to be borne in mind that very few districts in the Madras Presidency are comparable with Travancore in the matter of fertility. Progress is evidently being aimed at, and if agriculture generally, and "planting" in particular, are pushed forward on lines similar to those suggested in the report, with reference to forest products, there should be a grand future before planters in the State. The forest tracts cover nearly half the area of Travancore. They constitute its most valuable asset, bringing in four lakhs of rupees per annum; yet, says the report, they are not yet worked otherwise than superficially. Their tropical position, their splendid and unfailing rainfall—from 100 to 200 inches—and their general external accessibility by river and backwater, point them out as capable of producing and placing on the market

in any quantity products essential to modern needs; such as camphor, now consumed enormously in modern explosives and to the value of many lakhs in India, India-rubber for which the demand is unlimited and which is apparently producible by several species of tree, gutta percha, other gums, resins and drugs, oils, timber, fibres, and paper material, match woods, and so forth. A forward step has been made towards introducing valuable exotics in sending to Formosa for seeds of the camphor tree.

The report points out, with special reference to the products mentioned above, that development is hardly possible to individual private enterprise owing to the knowledge, capital and time required; an organized and continuous State department with a keen perception of the markets exactly fills the position. At present teak plantations are almost the only form of such enterprise; mahogany can hardly be said to have been seriously tried, though long ago introduced; perhaps a more extended introduction of commercial valuables may now be possible. Seeking a lesson from outside, the writer of this report observes that at the Peradeniya and Hakgalla Government gardens in Ceylon, especially at Hakgalla, the camphor tree is being successfully and rapidly grown; probably cuttings from those gardens could be obtained and, for experimental purposes, would prove better than seed from Formosa, which, however, will be needed for extended cultivation. He then passes to minor produce, and suggests the desirability of developing the collection of existing forest produce other than timber is suggested; it is admitted by the Conservator that this is undeveloped and that more might be done; *e.g.*, there is a demand for the valuable gum kino, but the collection is prohibited because of doubts whether its collection may harm the trees which produce it, a doubt which might surely be easily solved. The report proceeds:—There must be many rich products in these forests, and it would be well to ascertain and collect them. Obviously, however, the Conservator is right in alleging that the small income is due to the present inaccessibility of the interior of the main forests, through the entire want of internal roads. This want has been adverted to by successive Residents, but is still a want; in 1070 and 1071 together, only Rs.3,409 were spent on forest roads; in 1072, Rs.1,979 out of Rs. 3,398 sanctioned; in 1073, only Rs.819 out of Rs.1,582! As a provision for roads and bridges, this allotment is insignificant, and the failure to spend even the allotment is regrettable; an expenditure of less than one rupee per 500 of income is mistaken economy. Moreover, it would seem that not only roads but decent shelter sheds for staff and workmen should be prodvided, if the forests are to be properly explored and exploited. Again, it is suggested, in view of the approaching railway construction, that special consideration be at once given to the supply of sleepers; irul and other suitable timbers appear to abound; perhaps they are also accessible. Two lakhs of sleepers at Rs.2-8-0 to Rs.3 each would be a large addition of forest revenue.

There is a good deal in the above observations that deserves the consideration of Forest officials in the Madras Presidency, and, though, perhaps, few planters will have a direct interest in the experiments of the Travancore State, we trust that there are at least a very few who are keen upon watching the progress of every effort to introduce new products. That private enterprise is not absolutely wanting is instanced by the attention given to Tea cultivation, and by the increased attention that is being given to Cardamo But there are many matters that the State should certa take in hand. The first essential towards progress is a rec nition that it is needed, and on this point the report bef us is very clear. It states that the need for agricult capital and its usefulness in operation are as great in Trav core as in British India; greater probably, because ther probably a readier return: low forests and scrub-jun abound in many tracts where capital is needed for little m than clearance and levelling; immense areas of shallow ba water may be turned into most valuable plantations; in south and south-east, where the rainfall and soil are sim to that of Tinnevelly, the borders may be known by entire cessation, on this side, of irrigation wells. It is deem probable that the same causes prevent applications in Trav core as used to prevail in British India, and that a f lakhs of the reserve would be excellently invested in loa "since they would not only bring the Sirkar 4 per cent. actual interest *plus* an increase in revenue, but also an calculable addition to the wealth and stability of the ryot a to food production." Thus, on paper, at any rate, the T vancore Government manifests a revival of interest in pla ing matters; may it prove to be of a really practical a permanent character.

THE PROSPECTS OF COFFEE PLANTING.

We publish to-day a Brazilian view of this subject, a note, with considerable interest, that the pinch is eviden as acutely felt in the home of cheap coffee as in Ind where the highest quality of mild coffee should flouri The *Brazilian Review* paints a somewhat gloomy pictu It draws the conclusion that removal of the export duty Brazilian coffee would tend to make matters worse rath than better, as it would stimulate production. The idea the advocates of this course is, no doubt, that it would a stimulate consumption by bringing the price of coffee do as compared with that of tea. The *Review* holds a differe opinion and sums the whole matter up by asserting that " present the kindest thing to be done is, if anything, to hast the liquidation of an industry that, under existing circu stances, has become unprofitable." But how is this to done? We fully share the view that "to stimulate produ tion further in any manner, when coffee is a positive drug the market, would only prolong the agony." Yet what do the so-called liquidation process mean? Merely, ruin planters, "bargains" for capitalists, and a more vigoro working of estates bought for a song and thus not ove capitalised at the very outset. True, some estates may given up; but it is, unfortunately, the rule among planter as among other strugglers for life, not to go to the wa until they are forced. No man is willingly the first "chuck coffee." All hang on hopefully while there is a spa of hope left; and we fancy the mortgagee or the capital who forecloses on the estates he holds in pledge will do as a rule, with the object of trying to make *Coffee* pay, n with any intention of experimenting with other products letting the land lie waste. Of the *best* remedy for the prese stagnation, of the active whipping-up of demand for coff the *Brazilian Review* says not a word. Surely, the Ceyl tea-men have indicated the right road out of the mire.

THE MALARIAL MOSQUITO.

We have said a good deal about this insect of late. It is one with which planters have to reckon, and when they urged upon Government the deputation of Major Ross, I.M.S., they acted not so much in self-defence as in the interests of their coolies. Professor Koch and some others appear to have joined in the investigation, or rather to have conducted one of their own, and the result is that the murderous malarial mosquito is as much a topic of the day as the most recent human murderer can ever hope to be. Professor Koch seems to make out that the mosquito pumps malaria into human beings one season and sucks it out again the next from all whom quinine has not freed from the disease. Now who *began?* Did the human brute once impart the malaria poison to the innocent fly, or was a mosquito Adam responsible for the original sin? Here is a point for antiquarians. Anyhow, Professor Koch and Major Ross agree that the malarial mosquito is of the genus *Anopheles*, and not of the genus *Culex*, while the latter states that in the case of the *Anopheles* the insect sticks its body out almost at right angles from the wall, while the *Culex* drops its body parallel to it. Further, it breeds in puddles, and a very little kerosene oil in these renders them barren "breeding-grounds." Major Ross says, therefore, put kerosene oil in the breeding places, and sleep under mosquito-curtains, so that you may not be infected before the malarial fiends are exterminated. Professor Koch, on the other hand, hopes to discover a serum that will cure the disease. As the serum has not been discovered yet, while kerosene and mosquito-net have, we rather fancy that Major Ross will have more followers at first than Professor Koch; but the inoculation mania is "catching."

THE TEA BUYERS' ASSOCIATION, LONDON.

The Tea Buyers' Association, formed at the time of the dispute over the pound draft question, has now been placed on a stable basis and has a strong and influential committee, with offices at Ingram House, 165, Fenchurch-street, E. C. The President of the Association is Mr. William K. Appleton, the Honorary Treasurer Mr. John Lecky, and the Committee include—Messrs. James and I. Batten & Co.; Brooke, Bond & Co. (Limited); S. Hanson, Son & Barter; Harrisons & Crosfield; Home & Colonial Stores (Limited); Kearley & Tonge (Limited); Lipton (Limited); Mazawattee Tea Company (Limited); Moffatt & Co.; Peek Brothers & Winch (Limited); Reinachs, Nephew & Co.; Joseph Travers & Sons (Limited); and the Co-operative Wholesale Society (Limited). Into this Association the Wholesale Tea-dealers' Association has been merged. A circular to the members says:—

We beg to inform you that we have opened an office at the above address (165, Fenchurch-street, E. C.), and have appointed as Secretary and Inspector Mr. J. A. Brown, who will be pleased to do all in his power to assist members to investigate any matters of irregularity at the warehouses with regard to complaints respecting their teas. Delays of delivery at any warehouse can best be dealt with by members themselves. Should, however, the complaints of delayed delivery be so numerous as to indicate inattention or insufficient accommodation, the Secretary has instructions to report to the Committee. Very full particulars of any matter to be placed before the Secretary must be furnished, and a personal interview is desirable. Mr. Brown will be at this office always between 10 and 11 clock. It is not intended at present to charge any fee for inquiries.

The *Grocer* states that, in a letter addressed to the Chairman of the Clearing House, the Association has made a formal request that members of that body shall afford Mr. Brown every facility to inquire into any matter concerning members' teas, and also that they will permit him to examine generally any parcels of tea that are printed for sale, or about to be printed for sale, in order that the members of his Association may be assured that the various operations, as stated in the public sale conditions, have been carried out prior to the day of sale. A copy of this request has been sent to the proprietor of each warehouse.

It remains to be seen how the scheme will work, and whether its directors will aim at harmony, or conflict with the importers who wish to regulate the placing of tea supplies on the market. As there does not appear to be much probability of hostility benefiting either party, we may reasonably hope that there will be peace, and that permanent friendly relations will be established to the mutual advantage of all concerned.

BOARD OF TRADE RETURNS.

SEPTEMBER 1899.

We append the statistics relating to the products that chiefly interest our readers, and those that come most directly into competition with these products:—

Cocoa (raw) shows smaller deliveries for home use, but a generally healthy position.

In the first nine months.		1899.	1898.	1897.
Imports... ...	lbs.	37,935,179	35,702,034	30,309,198
Home consumption...	,,	25,974,865	23,278,260	20,667,905
Exports... ...	,,	8,701,495	8,275,975	11,020,787
Stocks in bond ...	,,	19,066,000	18,790,000	22,370,000
Value of imports ...	...	£1,137,707	£1,098,881	£800,090
,, exports ...	...	270,195	265,878	296,408

Cocoa (prepared) was in much scantier supply than before, and the bonded stock remained low.

In the first nine months.		1899.	1898.	1897.
Imports... ...	lbs.	3,697,108	6,165,053	6,298,093
Home consumption...	,,	3,978,051	4,601,807	5,635,030
Exports... ...	,,	572,207	492,244	386,984
Stocks in bond ...	,,	468,000	1,451,000	358,000
Value of imports ...	...	£356,105	£454,145	£421,273
,, exports ...	...	62,939	53,250	43,098

Coffee—with smaller arrivals and full average deliveries gained ground a little, though it still leaves much to be desired.

In the first nine months.		1899.	1898.	1897.
Imports... ...	cwts.	907,057	837,909	666,814
Home consumption...	,,	196,691	189,616	186,455
Exports... ...	,,	458,842	415,042	346,438
Stocks in bond ...	,,	558,000	432,000	243,000
Value of imports ...	...	£3,187,837	£3,365,910	£3,055,603
,, exports ...	...	1,577,396	1,611,986	1,495,728

Chicory.—A steady trade is recorded, though the stock was diminishing.

In the first nine months.	1899.	1898.	1897.
Imports... ... cwts.	66,482	70,528	73,659
Home consumption... ,,	56,653	57.179	61,219
Exports... ... ,,	379	381	1,104
Stocks in bond ... ,,	16,000	20,000	16.000
Value of imports	£31,248	£30,406	£32,730
,, exports	432	384	1,133

Tea.—Increasing deliveries; but stocks in bond well maintained. China recovered a little in Imports and Consumption, but Exports from Great Britain showed a further falling off. Stocks heavy.

In the first nine months.	1899.	1898.	1897.
Imports—China ... lbs.	24,634,848	19,460,330	18,670,278

Value of exports	1,005,378	1,107,442	1,131.388

TEA STATISTICS.

The Indian Tea Association is urging upon the U. P. A. S. I. the necessity for more accurate statistics than have hitherto been prepared with respect to South Indian—and especially Travancore—teas. The *Home & Colonial Mail* refers to "the misleading character of the figures with reference to the area of tea in Travancore published by the Government authorities for the period of 1897-98" as having almost caused a scare in Mincing-lane last year! That the blunder was a bad one is evidenced by the fact that, according to official returns, the area under tea cultivation in Travancore in 1898 was only 19,634 acres, as against 30,076 acres a year earlier, while the outturn was put at 2,545,913 lbs. off the larger area, and 8,413,860 lbs. off the smaller!! By the way, in commenting recently on some remarks of the *Indian Planters' Gazette*, we alluded to the absence of reference to figures of *production*; our contemporary's reply is to the effect that the criticism is not quite just, as it also gave figures put together in India, *in so far as they were procurable*. (The italics are ours). It goes on to say that reliable statistics "are non-existent. Government blue-books afford a certain amount of information on the desired subjects, but they are meagre and inaccurate: in some cases very wide of the mark, because, as the officials say, planters simply will not give the desired information." This shows that planters in the North are much like their brethren in the South. The *I. P. G.* adds: "It is not only with the want of statistics that we have reason to complain against planters, but also against the indifference shown, generally, against supplying really useful, practical information on all subjects connected with tea estate management, cultivation, manufacture, etc. Amongst the few practical men who do contribute to our planting journals, it appears to be a growing fashion to dilate on any and every subject rather than tea—which is severely left out in the cold. Is it because we have learnt everything about tea that it is possible to learn"? In Ceylon, things are different; and, while we do not wish planters to neglect their estates in order to "write to the papers," we certainly consider that the Ceylon men have gained not a little by discussing planting matters in the local papers, a course they have followed so far that practically every issue of the chief "dailies" in the island constitutes a standing reminder of the vast importance of the local planting industry. South India has improved a little of late years in this respect; but still leaves a great deal to be desired.

TOBACCO CULTIVATION.

We have received several letters—mostly not for publication—on this subject of late; and, now that tobacco is actually being taken up by planters, we have decided to include it among our "subjects," and give, from time to time, information in regard to methods of cultivation, curing, &c. If any of our readers can assist us—more especially in regard to experience acquired *in India*—we shall be very grateful for any papers—original or otherwise—that they can bring to our notice. The subject is a somewhat wide one, for it embraces tobacco for cheroots, pipes and cigarettes; *jâts* and systems of curing differ very materially, according to the particular purposes to which the leaf is to be put; and of course climatic, atmospheric and soil influences must also be taken into account. We are glad to know, however, that experiments are in process in this country, not only with the strong tobacco so common in the South, but with milder descriptions. It is to these latter that we specially wish success.

THE BRITISH TEA DUTY.

We are glad to see that *Capital* and the *Indian Planters' Gazette* are not in agreement with the Indian Tea Association on this subject. The former paper, while admitting that no doubt a reduction in the duty on tea is a factor in increasing the consumption of tea, adds: "but a far more potent one has been the advent of men like 'Lipton,' who have cut profits and sold tea at popular prices." It also quotes one of its correspondents as saying:—"I am at one with the Ceylon Planters' Association in thinking that the time is scarcely ripe for a movement in favour of the reduction or abolition of the duty on tea in England, and all those interested in the question must feel that the time is not exactly opportune

Revenues, of course, must be raised, and a fair view of the question will show that a duty on tea is, in every way, as appropriate as a duty on salt or piece-goods. Statistics have shown us that the excise-duty on beer and spirits in England has not reduced their consumption to any appreciable degree, and we feel sure that, while good tea can be bought at Lipton's prices, the matter of duty may be dismissed without any further discussion." The *I. P. G.* asserts that it has consistently maintained that the time has not arrived to urge the removal of the impost that has so hampered the Indian and Ceylon industry, and adds :—" The action of the Indian Tea Association in urging this matter at the present moment we take to be an attempt to turn public attention from the 'draft bungle' and warehouse charges." When criticism such as this is evoked "at home," what must be expected from those who have watched the game from Ceylon and Southern India ?

In this connection, we reprint the following letter from Mr. North C. Davidson, of Udapussellawa, to the Colombo papers :—

It seems to me that, instead of the tea producer trying to get the Customs style of weighment altered from 1 lb. to ½ lb., we should try and get the taring at the Customs done away with entirely.

It must be an easy matter to prove to Government that the even taring of tea chests at the Customs means only increased labour to the Customs officials, and a *dead loss to the Revenue.*

The duty charged is on the tea. Why should the Customs then weigh the tare? And, should the tare exceed the exact pound, why should they deduct an extra pound from the declared nett weight of tea, and by so doing charge duty on nearly 1 lb. per package *less* than is actually received into England?

Everyone knows that, should a chest arrive at the Customs, marked 100 lbs. nett and 127 lbs. gross, and the Customs on weighing find that the *tare* weighs $27\frac{1}{16}$ lbs., they call the tare 28 lbs. and the nett 99 lbs., and levy duty on 99 lbs. only—the revenue thus losing $\frac{15}{16}$ of 4d.—and this not on a solitary chest, but on the whole break, as the 28 lbs. tare is taken as the average. The only gainer by this system is the buyer, who is already protected from loss by the 1 lb. draft allowance and by the few ounces extra put in at the factory to ensure the declared nett weight.

Why should the Customs not accept our declared nett weight, as printed on each package, and charge duty on the full amount? No Superintendent would knowingly pack less than the declared nett weight; and if, on purchase, the weight was found to be short, the buyer has the right to throw it back on the seller's hands, so that the buyer would have no just cause of complaint.

The abolition of even taring at the Customs would mean the same in the factory, and all Superintendents know how difficult it is to tare evenly. Take Momi ½ chests, 17 in. by 17 in. for example. These vary, including lead lining, from $15\frac{1}{4}$ to $17\frac{1}{4}$ lbs., and the difference has to be made up in waste lead, &c. To do this entails considerable trouble and expense, and the result is always unsatisfactory, as any chests exposed to wet weather, in the carts, absorb several ounces of moisture, and the evenness of the tare, arrived at with great trouble in the factory, is lost again.

The abolition of even taring at the Customs would, therefore, be a distinct gain to the producer, to the British ratepayer through the Revenue, and to the Customs—by reducing the work considerably—and would be no loss to the buyer.

The Superintendent would, for his own sake, tare as evenly as possible, *i.e.*, within a couple of pounds or so, and the Customs could always open chests to ascertain the contents *were* tea, and not some articles on which a higher duty should be charged.

A reform on these lines would not lead to another fight between producers and buyers, as it is a matter for the Government to decide.

The letter is interesting, if only as creating a diversion, and, no doubt, it will elicit comment from other planters.

NOTES.

Liptonia. That packets are more in Sir Thomas' line than racing yachts.

A Record broken. Ceylon deliveries in London for October totalled 9,400,000 lbs. This is the highest total yet reached, the previous highest being 8,962,686 lbs. in July 1897

Mexican Coffee. Coffee planters should study with particular care, the remarks of the *Mexican Herald* on what American Companies are doing in the Isthmus of Tehuantepec. We quote these on another page under the title of "Coffee Plantations in Mexico."

A Debt paid. "America cancelled its debt to Asia and Africa for their gift of tea (the world's most famous leaf), and coffee (the world's famous berry) by bestowing *Theobroma*, or cocoa 'the food of the gods.'" So says the *American Grocer.*

Export of Indian Tea. According to Messrs. Watson & Sibthorpe's statement of tea exports for October, the exports this year to Australia, compared with those of last year, have decreased by 45,000 lbs.; but the exports to foreign countries have increased by 700,000 lbs.

"Indian Museum Notes." Volume IV., No. 5, comprises a list of the Melolonthini contained in the Collection of the Indian Museum, a description of a new Pear-tree Aphis from Ceylon. Notes on two new Species of Aphids from India, and a description of a new Parasitic Tachinid Fly from Ceylon.

Calcutta Tea Sales. The average price at the last tea sales was 6 annas 3 pies. About 22,000 packages were to be offered on Friday last. At the sales on 31st ultimo, 19,600 packages of tea were sold. There was a strong enquiry for Pekoe Souchong, which was occasionally rather dearer.

An Antiquity among Advertisements. "That excellent and by all physicians approved *China* Drink called by the *Chineans Tcha*, by other Nations *Tay alias Tee*, is sold at the *Sultaness Head Cophee House*, in *Sweetings* Rents, by the Royal Exchange, *London.*"—*Mercurius Politicus*, September 30th, 1658.

Amsterdam Bark and Quinine Markets. The amount of bark listed in the combined catalogue for the Dutch auctions on November 2nd amounted to 5,182 packages, comprising 469,224 kilogrammes. This is equivalent, roughly, to 470 tons of bark, and $23\frac{1}{2}$ tons of quinine. It is only about three-fifths of that put up at the last previous auction.

Cocoa and Chocolate in the United States. The growth of the chocolate industry in the United States is indicated by the imports of crude cocoa, which for the year ending June 30, 1899, were 35,512,364 pounds, of which 2,361,336 pounds were exported, leaving net imports of 33,151,028—an increase over imports of 1896 of 50 per

cent., and 100 per cent. greater than ten years ago, or in 1889, when the net imports were 15,244,488 pounds.

Tea Prospects in Northern India. The Indian Tea Association cabled to London on the 2nd instant that Assam prospects, throughout the districts generally, are favourable. In Cachar cold weather generally has set in. Sylhet, Dooars, and Terai prospects, throughout the districts, are favourable. The Darjeeling season has practically closed. The outturn last month was good

A Permanency. Of course, says Mr. A. H. Gardner in the *Canadian Grocer*, Ceylons and Indians have come to stay, as they are the best values, and the grocer wants to buy them blended, but not in packets. It costs the consumer 2 to 3c. per lb. extra for the cost of packing. If this were added instead to the quality of the tea, is it not plain that the trade would receive that much more for their money ?

Tea in London. The following are the particulars of stocks of Ceylon and Indian Tea in London on 31st ultimo :—

	Lbs.
Ceylon tea stock	21,100,000
Month's landings	8,400,000
Do. deliveries	9,400,000
Indian tea stock	46,100,000
Month's landings	24,300,000
Do. deliveries	13,700,000

The Paris Exhibition. It has been definitely announced that the sale of tea in packets will not be permitted at the Paris Exhibition, though the distribution of samples will be allowed on certain conditions. One is that the boxes or packets distributed shall not advertise special firms or gardens. A notice of moderate proportions, and of an artistic character may be displayed on the walls of the Tea Courts to the effect that the teas used there can be obtained at the central depôt.

Brazilian Statistics. It is not only *Indian* statistics that are unreliable. The *Brazilian Review* impugns official statistics of Coffee, and, after giving figures that appear to prove that there is something very seriously wrong, remarks :—"This difference, equivalent to 80,997 bags in two months and a half, is so enormous as to demand an immediate investigation as to the methods employed to obtain the official figures." It is almost superfluous to add that official estimates of arrivals are *below* the mark.

Coffee Disease, Nicaragua. The following is Mr. Massee's report on coffee leaves showing a fungoid disease received from Central America for identification :—"The disease is caused by *Stilbum flavidum*, Cooke, a minute fungus resembling miniature golden pins, scattered on the white patches of the upper surface of the leaf. Spraying with Bordeaux mixture would check the spread of the fungus. Diseased fallen leaves should be collected and burned.

Hard Times. At a General Meeting of the Selangor Planters' Association on 30th September a resolution was put forward : "That in view of the distressed condition of coffee planting in the State the Government be asked to remit the quit-rent on all blocks of 200 acres and upwards until such time as prices improve." An amendment was adopted, that Government be asked to remit the quit rent on the unopened portions of estates until better times." It was remarked incidentally that "for the present coffee has gone to the bad."

The London Tea Market. Cabling on the 2nd instant, Messrs Gow, Wilson and Stanton reported –Competition is general and well distributed ; the market for medium liquoring pekoes and broken pekoes shows a fractional advance, teas for price dearer ; Ceylon Pekoe Souchong is 6¾d. (¼d. up). The average price of Ceylon tea sold on Garden Account during the week was—8⅝d. (½d. up). Reuter states that 22,000 packages of Ceylon tea were sold out of 23,000 offered, and 48,000 Indian out of 49,000. The average of Indian for the week was 9d. (⅝d. down).

The American Tea Trade. It is remarkable to think the change that has taken place in the demand for teas of India and Ceylon. Formerly it used to be an exception rather than a rule to find a dealer who carried more than a few packages ; but now, not only does every dealer carry half a dozen lines, but every grocery store, tea shop, or department store, from one end of the country to the other, is perfectly familiar with the merits of India and Ceylen tea, and apparently takes pleasure in pushing them. In 1893 the importation was about 4,000,000 pounds ; in 1898, 12,000,000 pounds, showing the fruits of the money spent in advertising by the India and Ceylon Tea Associations.

The British Tea Duty. Calcutta is hammering away at Ceylon in the hope of producing an amalgamation of ideas on the subject of the abolition or reduction of the British Tea-duty. South Indian Associations for the most part hold that the present is not a favourable opportunity for pressing this matter upon the British Government, while the *Madras Mail* touches upon the fact that the Indian Tea Associations' arguments are all based upon an assumption that a reduction of the duty on tea *alone* might be brought about. Coffee-men would naturally oppose any such partiality, and we fancy the Government would be slow to accord tea any special preference.

United States Experimental Tea Garden. The only tea plantation in the United States, at Summerville, S.C. The estate, known as Pinehurst, covers 700 acres, of which fifty are devoted to the cultivation of tea. The first "Rose Garden" was planted in 1890. In 1894 151 pounds of tea leaves were harvested ; in 1895, 33[illegible] pounds ; in 1896, 6[illegible]0 pounds ; in 1897, 648 pounds ; in 1898, 1,200 pounds. On the basis of 900 plants, the production per bush is almost five ounces of tea. This tea has a distinctive character, and retails in the local market at $1 per pound. It compares favorably with tea bringing 25 cents a pound in lines in the New York market.

Geographical Distribution of the Tea Plant. At the International Geographical Congress recently held at Berlin Mr. J. M'Ewan read a paper on the geographical distribution of the tea plant. It is a curious and interesting fact that almost the entire production of tea is raised within an area confined by 40 degrees of latitude and 50 degrees of longitude, and it is no less remarkable that the consumption shows itself to have strictly geographica

limitations. Outside of the domestic consumption of China and Japan, regarding which no reliable statistics can be obtained, the principal tea-drinkers, according to Mr. M'Ewan's researches, are the people of Great Britain, Ireland, and of the British colonies, the people of the United States and those of Russia.

The Alkaloidal Content of Cinchona.

According to an article appearing in the *Journal de Pharmacie et de Chimie*, the following are the usual limits of alkaloidal content in various groups of bark :—1. Succirubra from Java, 6 to 8 per cent. of total alkaloid ; quinine sulphate, 2 to 3 per cent. 2. Loxa, from St. Thomas, 5 to 6 per cent. of total alkaloid ; quinine sulphate, 2 to 2½ per cent. 3. Loxa, from Nilgiris, 4 per cent. of total alkaloids ; 1 to 1½ per cent. of quinine sulphate. 4. Calisaya, from Bolivia, 5 to 6 per cent. of total alkaloids ; 3 to 4½ per cent. of quinine sulphate. There is room for Nilgiri bark to improve, and it is to be hoped that one effect of Mr. Standen's recent visit to Java will be an increase in the alkaloidal content of Indian-grown cinchona.

Rejected!

The *New York Merchants' Review* remarks :—"The shutting out of inferior teas from this country has naturally led to a larger movement of low-grade leaf towards the British Isles, but most of it is prevented from entering by the Customs officials. Of late the Treasury has ordered greater vigilance to be exercised at the request of members of the trade. It is reported that more inferior tea has been excluded during the past six months than during the previous four years. If the rejected tea is not destroyed at once, it may be sent to some other country, or treated with lime and assafœtida, preparatory to the extraction of the alkaloid, caffeine." There is, we fear, but too much reason to fear that London is the most accommodating dumping ground for rubbish heaps such as here referred to, and that previous little of the stuff goes to swell the production of caffeine.

Demand for Black Teas in Canada.

The *Canadian Grocer* of the 6th ultimo says :—There have been some interesting developments in Montreal this week in relation to black teas of all sorts, but especially Ceylons and Indias, in which an absolute scarcity of certain grades exists. Montreal brokers who had orders this week for the teas mentioned could not fill them, except at a material advance. In one case, an Ontario firm had to raise their bids 3½c. per pound before they could close their purchase, and shortly after the seller bewailed the fact, as he could have made more money. The scarcity appears to be chiefly in teas worth from 17 to 19c., and it is interesting to note, as showing the increased cost this year, that the same grade of goods were obtainable this time last fall from 12 to 14c. Advices on China Congous are strong. These also have an upward tendency, and cables state that the Russians are expected to take a third of the entire crop. In Japans the same strength does not exist, and business in them continues dull.

"Mr. Chisholm, India."

"Smith of London" is known to all good men in Madras ; "Mr. Chisholm, India," is familiar—though not perhaps by this title—to many of our readers. Note what the *Cairns Argus* says :—"First-class coffee seed is advertised for sale in our business columns. The advertisement came direct from the advertiser, another conclusive proof of the widespread circulation of the *Cairns Argus*. Our coffee growers cannot do better than import some of the seed offered by Mr. Chisholm, India." Now see what has to be said "on the other side." Mr. W. A. Hannan writes to the above contemporary :—"I see you have an advertisement in your last issue *re* coffee seed for sale, grown in India, too. I should certainly not advise anyone to order any, for the importation of coffee seed into Queensland is especially prohibited by Act of Parliament, and rightly too. We are free from leaf-disease now, and wish to remain so." Under these circumstances, Indian Coffee-seedsmen need scarcely advertise in Queensland newspapers.

1869 - Review of Prices—1899 (America).

A glance over the tables of comparative prices of leading staples, for the past thirty years, shows that there has been a steady decline in cost, and says, the *American Grocer*, in many instances the fall has been so marked as to be almost incredible. For instance, refined sugar is about one-third its cost in 1869 and so is coffee. Tea, notwithstanding a duty of ten cents a pound, is one-half or more lower. Canned salmon has fallen from $4.00 to less than $1.50 per dozen. This drop in prices results from various causes, prominent among them being the application of steam, electricity and machinery to the production, transportation and manufacture of food ; the work of the chemist, and co-operative industry. There is scarcely an article within the entire range of food that is not prepared with greater skill, and in a more thorough and economical manner than ever before. With food, as with other things, the former waste has been utilized until nearly everything has been given a commercial value.

Brazilian Exchange.

Says the *Brazilian Review* of 16th September :—"Ninety days bank rate on London opened on Monday 11th at 7 21/32 rose to 7 3/4 on the 13th and finally closed this evening at 7 21/32. Although tonnage is so short, coffee is going forward rapidly, the value of this week's shipments being £477,665 as against £255,099 last year, and declared sales here and at Santos 267,000 bags as against only 198,000 last year, exchange sticks and despite the general conviction that a reaction is imminent, refuses to budge, or if it do so in the wrong direction.". . . Apart from the immediate prospects of rise and fall it cannot be denied that the present fall of exchange is a disquieting and disappointing symptom. Even if the fall were the exclusive result of speculation, which it is not, it would be none the less alarming that just at this time when coffee bills are most abundant, speculators should have been able to bear rates at all ! As a symptom we regard it as most unhealthy. If such things are possible in the green tree, what will be done in the dry" ?

A Novel kind of Hospital.

The New York Tribune announced some time ago :—The United States clipper bark *Jacob A. Stamber* is being fitted up as a hospital ship at Stapleton, Staten Island, N. Y. It is said that, when the improvements are completed, the ship will be taken to the coffee plantations owned by Arbuckle Brothers in Brazil for the reception of their employees who may be taken ill. The vessel is 175 feet in length, 39 feet beam, and 23·3 feet in depth, with a displacement of 1,000 tons, and was built in Brooklyn, N. Y., in 1856. The *Brazilian Review* rounds the news off by saying :—In addition to these particulars we

may add that the ship is to be fitted with sixteen 82" driving wheels and be mounted on a truck with 52" wheels, the wheel base being adjustable to any gauge. This will be enabled to travel on any railway in the country, climb the mountains and pick the coffee from the trees as it runs along, thus avoiding all the cost of unnecessary handling and transhipment *en route*, and deliver straight to the New York Coffee Exchange at a minimum of expenditure, time and money.

Coffee in Hayti.

Violent fluctuations of price would appear to have characterised the market for Coffee in Hayti during 1898, if the following consular statistics are correct :—

	Per 100 lb. From Dol. c.	To Dol. c.
January	11·0	13·0
February	8·0	9·50
March	7·0	12·0
April	9·0	12·0
May	12·0	14·50
June	9·50	14·0
July	7·0	11·0
August	7·0	11·0
September	8·0	10·50
October	8·0	10·50
November	6·0	7·75
December	7·50	8·75

The January—March figures certainly appear to be erroneous, as there is such a wide gap between the quotation of one month (including the *last* day thereof) and of the next (including the first day).

Cinchona in Java and India.

The *Chemist & Druggist* has the following introductory remarks relative to Mr. Standen's report on his visit to Java and Annual Administration Report of the Nilgiris Cinchona plantations :—"The remarkable change in the position of quinine, which is mentioned in our Trade Report this week, once more calls attention to the anomalous behaviour of cinchona and its chief alkaloid, so far as price principles are concerned. Java has been behaving badly this year, in the opinion of speculators, by increasing her shipments of bark in face of a rising market. According to the prophets the shipments would not increase, either because the planters had at last seen that their best policy was to get double prices for half the normal supply of bark, or because their plantations are shrinking in production. Now the indicator on the speculative dial has swung round with a vengeance, and at the moment the quinine-manufacturers are giving quinine-speculators as hard a squeeze as they have felt these past two years. It is all the harder because it was unexpected. At the critical moment we receive two valuable reports having an indirect bearing upon the matter, which it may be well to give the gist of, especially as one of them deals with that abstruse problem—Java cinchona."

The German Quinine Trust.

The *American Druggist* has interviewed some Chicago wholesale druggists on the likelihood of breaking down the German quinine trust through a movement recently started by leading cinchona-planters in Java, to keep the raw material out of the hands of the syndicate ; but none of the druggists have any faith in the scheme. The following are substantially the remarks of a few wholesale houses :—"If a market is established in Java, as is suggested, we do not see what is to prevent the German manufacturers fr going there and securing supplies, and we do not see h conditions will be changed from what they are at prese The only way the Javanese can keep their bark from t German manufacturers will be to use it all themselves, the Germans certainly will bid as high as America Besides, the Java quinine is not of a quality to meet wi ready sale here, because of its colour." *Apropos* of this, read in a consular report a lamentation arising from the fa that crops of bark in and shipments from Java have be large ; the quantities sent to the Pandan-Aroem, and Bandor factories have been very small, so that they are in gre danger of having to close. Instead of giving their bark the local factories, the planters, as soon as the unit rose 4½c., preferred to ship their cinchona to Europe. The America Consul naively concludes his report with the remark that " seems very shortsighted in Americans to swell the profits of German trust." However, since January 18, 1899, the da of the first direct shipment of quinine sulphate from Java the United States, he has certified invoices for the shipme of 265,900 oz. quinine sulphate. Up to the present tim however, there have been no direct shipments of cinchon bark, although he has received an inquiry from a Philadelph manufacturer asking if it were not possible to import cinchon bark direct from Java without the intervention of t European trust.

LETTERS TO THE EDITOR.

TOBACCO.

DEAR SIR,—The note on tobacco, as an "auxiliary" t coffee, in your issue of 28th October, interested me, as put down some tobacco-seed at the beginning of the monsoo and have since planted it out in coffee land. It has grow very well, and has been topped at 18", that being, I believe about the right height. The next thing will be to pluck an wither the leaves ; but as to what size the leaves should b allowed to grow, or how they should be withered, &c., I a ignorant. If you, or any of your readers, would give me few tips, I should be very much obliged. The seed I put dow was some I got out of a Gowda's tobacco-field. Whethe it is a good jât or not, I don't know ; but the plants are, think, well grown, and I intend sending a sample of the lea to a firm of cigar manufacturers, if I can get it properl dried, &c.

CHUNGU.

GENERAL ARTICLES.

THE PROSPECTS OF COFFEE PLANTING IN BRAZIL.

We take the following from the *Brazilian Review* :—

Since the commencement of 1897, when the big crop of coffe occurred, the position of coffee has been going from bad to wors until it seems to have culminated in prices that in many district do not cover cost and even in the most favoured leave but a bar margin of profit insufficient to compensate the capital employed.

On July 1, 1896, the visible supply stood at 160,320 tons, grew t 239,000 on 31st December of the same year and reaching 386,8 31st December 1898 has gone on growing ever since threatening t reach 400,000 before the end of the year.

The increase in quantity was followed, naturally, by depreci tion and prices, which were maintained between 80 and 90 franc

until 1896, fell to fr'cs 47 in 1897, fr'cs 35,50 in 1898 and lastly to fr'cs. 32 the current price at Havre.

In 1895-96 the production of Brazil Coffee was 5,480,000 bags: in 1897-98 it had risen to nearly 11,000,000 !

Under such conditions the fall of prices, though certainly exaggerated and facilitated by the simultaneous depreciation of the currency, was inevitable, nor is there any hope of any considerable improvement until production and consumption are more closely balanced either by the shrinkage of the former or increase of the latter, or both.

The state of things now obtaining amongst planters leads to the belief that before very long production must undergo a considerable modification unless artificially fostered. Overloaded with debt, unable not only to meet their mortgage charges, but what is worse to even compensate labour adequately, the difficulties of the planter are becoming so overwhelming as to make it impossible to many to maintain the struggle much longer.

Mortgages may, it is true, press hard upon the planter, but after all, when purchasers are not to be found and creditors see no means of even working the estate without loss on any terms whatever, few, and certainly not the banks, will be particularly anxious to foreclose.

There are, of course, some foreclosures even on such conditions, but if any one expects to purchase *fazendas* (plantations), even now at the ruination prices referred to in the leading article of the *Rio News* of September 19, he would be sadly disappointed.

In fact plantations are sold at the rate of about 1$000 (one milreis—8d.) per tree to-day as they have been for the last twenty years, the alteration being in the value of the milreis; and, were the matter examined into, it would be found that the plantation costing over 500:000$, that our contemporary represents as having been sold for only 10:000$, or 1/50 of the cost was probably mortgaged up to its full value at that valuation, and that the cash payment of 10:000$ represented in reality so much paid over true value to get possession or to avoid transfer duties.

No estate ever worth 500:000$ on which 150:000$ had been spent in improvements could by any possibility go for only 10:000$. The buildings, stock and machinery alone would be worth many times that sum, not to mention the land, which can be put to other uses besides coffee planting.

No doubt the crisis is bad enough, but things have not yet reached such a pass that plantations are actually given away.

The most serious feature of the situation from a planter's point of view is that at present prices coffee does not yield sufficient to pay for labour. Wages, which were never high, have, consequently, been dropping and as they drop labourers, who are chiefly Italians and nomadic, emigrate. Some 15,000 are said to have left S. Paulo during the last two or three months and, should the exodus continue, there can be no doubt that labour will not only be insufficient, but that wages will rise to still higher and more prohibitive rates.

In that case, unless exchange should fall proportionately, which seems not unlikely, there is every chance of labour in S. Paulo being short and that a good deal of the next crop will remain unpicked, at least in outlying districts.

So far reports of the flowering both in S. Paulo and Rio are most favourable, but without labour to pick it, the heaviest and most promising crop will not avail the planter

In regard to Minas and Rio the conditions are somewhat different.

In these two States labour is chiefly local and attached to the plantations by a share-system in lieu of wages.

Being paid in kind, the planter is more independent than his S. Paulo colleague, and though the yield is far smaller in S. Paulo, succeeds better in retaining labour on the estate

Should the expectations of scarcity of labour be realized, there can be little doubt that next year's crop will suffer and that, though undoubtedly painful to the individual planter, in the long run it will not be so injurious to general interests as appears.

The *Rio News*, consistent to the end, hysterically calls on Government to reduce taxation and save this "the great agricultural industry of the country on which," it says "its credit depends, from serious disaster."

Taxation, of course, is a very bad thing always, and over-taxation still worse. But even the *Rio News* will scarcely maintain that Government is, except in an indirect manner, responsible for the over-production of coffee, to which, if statistics are to be trusted, the fall of prices and, consequently, difficulties of the planter are due. Nor, indeed, is it clear that even if taxation were abolished altogether, the eqilibrium between the supply and demand for coffee that can alone make prices we will not say rise, but keep from falling lower still.

Is it not clear that any relief that would again reduce the cost of production and delivery must at the present moment tend to increase in lieu of diminishing the supply and to, therefore, further depress prices ?

Should the State Governments remove the 11% tax to-morrow, is it certain that the producer would gain a corresponding advantage, or would not prices, rather, fall still further abroad in consequence ?

Either prices are, or they are not, controlled by the relation of supply to demand. If they are, as economists generally suppose, so long as the supply be largely in excess of the demand for coffee, cost may be reduced here and revenue be sacrificed, but without benefit to anyone except to foreign consumers.

At present the kindest thing to be done is, if anything, to hasten the liquidation of an industry that, under existing circumstances, has become unprofitable. To stimulate production further in any manner, when coffee is a positive drug in the market, could only prolong the agony.

What happened with Cotton in the United States will, unless production be checked, occur here too, and low prices and small profits persist for years until demand commence to gain upon supply.

Here, too, the problem is more complex because there is practically no other industry to fall back upon.

It is on this account that the prosperity of the coffee industry is of such vital importance, because upon it the whole financial and economical edifice depend.

In the interest of the country generally it seems, therefore, requisite that nothing should be done that can interfere with the indispensable and wholesome liquidation that is now in process, of an industry so inflated as to prove an impediment and menace to the general welfare.

The coffee boom, like all others, has run its course, burst and, naturally, hurt a lot of people in the process. The sooner it is finally liquidated and the industry placed on a solid and paying basis the better.

A GENERATION OF AMERICAN TRADE.

Says the *American Grocer* in an admirable special number commemorating its attainment of the age of thirty years :—

COFFEE.

Coffee challenges beer in being the National beverage The United States is the largest consumer of coffee in the world, importing an average, for the past three years, of 814,000,000 pounds. Making allowance for loss in roasting and assuming that one pound of coffee makes two gallons of infusion, we have 1,384,000,000 gallons as the total annual consumption. Coffee has been duty-free since July, 1872. The table presented gives the annual average cost of green Rio coffee, grading Fair:—

	Cents.		Cents.
1899 to Aug. 1	6.26	1883	10.36
1898	7.64	1882	9.77
1897	11 66	1881	12.23
1896	16.22	1880	15.12
1895	18.64	1879	14 85
1894	18.61	1878	16.51
1893	19.28	1877	19 72
1892	18.36	1876	17.97
1891	18.15	1875	19.01
1890	19 64	1874	21.08
1889	18.55	1873	19.99
1888	15.35	1872 (free from July 1)	18.42
1887	17.80	1871 (duty 3c)	25 91
1886	10.32	1870 duty 3c)	16.33
1885	9.01	1869 (duty 3c)	15.82
1884	10.92		

TEA.

The per capita consumption of tea in 1899 is almost exactly the same as in 1868, being 0.91 pounds and 0.96 pounds, respectively. From 1872 to 1888, it was fairly steady at an average of 1.40 pounds. Cheap coffee has been too much for duty-paying tea, and that together with the tea law restricting imports to a fixed standard, has checked growth in demand. It is very difficult to establish a satisfactory basis of grade for comparison for a term of years. Tea

was made duty-free July 1, 1872. From July 1870 to July 1872 the duty was 15 cents per pound. Tea remained duty-free until the tariff of 1877 imposed a duty of 10 cents per pound. The following table furnishes the average yearly cost of a popular grade:—

	Japan. Med to fine. Cents ℔ lb.			Japan. Med. to fine. Cents ℔ lb.
1899 to Aug. 1	26½	@27½	1884	22½ @23½
1898	21½	@18⅞	1883	19 @20⅝
1897	17¾	@18⅞	1882	20¼ @22½
1896	14⅝	@19⅝	1881	21½ @23¾
1895	13	@17½	1880	25 5-6 @27
1894	13	@18½	1879	29½ @30½
1893	14½	@20¾	1878	24⅛ @25⅛
1892	14 1-6	@21¼	1877	23 @24
1891	14	@20	1876	25¾ @2½
1890	15¼	@20⅜	1875	39 @41
1889	13⅝	@19	1874	44 11-12 @47 1-6
1888	12⅞	@19	1873	38½ @41¼
1887	13 5-6	@18¾	1872	46¼ @48 5-6
1886	16 5-6	@21 1-6	1871	56½ @59
1885	18⅜	@23 1 6		

THE AMERICA TEA MARKET.

Mr. John B. Brown, of Bronson, Brown & Co., writes to the *American Grocer*:—

Reviewing the past twelve months, those engaged in tea business can truthfully say that they have had serious obstacles to confront. When the duty was imposed large stocks of teas were held by all the trade on which no duty had been paid and these have been most severe competition. The market for free teas advanced rapidly until it assumed prices within two cents of what duty-paid goods were selling at, the holders receiving the benefit. All the old stock has by this time been used and the only available goods now are those which pay a duty.

Green teas in bond are ruling to-day at about the same rates existing in China one year ago. This applies to Ping Sueys as well as Country and Moyune Greens. The market for Formosa Oolongs has been seriously handicapped by the excessive old stock which has been largely reduced so that now the supply will amount to only about three months stock. The prices for new crop have ruled several cents per pound above the same quality of old crop, and it looks like an unsatisfactory market for importers of Formosa Oolongs, except for the better kinds, as these grades of the old crop have been entirely used and there is a fair demand for fine new crop Formosas

The better grades of Foochow Oolongs are a trifle lower than last season's, but the common to good are ruling equally as strong as last year.

Amoy Oolongs are practically extinct, the Government standard being so high as to practically exclude the importation to this country of the largest part of the crop.

The better kinds of English Breakfast have been purchased in China at a trifle less cost than rates existing last year. The lower grades, however, hold firm on a basis of last year. The rigid enforcement of the Tea Adulteration Act should compel importers to give most careful attention to the quality of their imports as if below the standard will surely be rejected. Jobbers, who are not familiar with the tea examination laws, know but little of the many complications connected with the importing branch in the trade.

COFFEE PROSPECTS IN NETHERLANDS INDIA.

Coffee cultivation in Java is now in a bad way. Planters lay the blame on the fall in quotations. But experts point out that good and well prepared Java coffee commands still a remunerative price, and certain brands of the article fetch fancy prices. It is held that planters have largely to blame themselves for the untoward turn of events by producing inferior coffee, bringing low-grade land under cultivation, and trying to do business in many cases on insufficient capital. In short, bad management has a good deal to do with the coffee crisis in that island. The result is that the quality of the berry has so gone from bad to worse that the Java article cannot stand the competition of the Brazil berry. Again planters, in the days of high prices, laid by nothing to meet adverse times. The latter took them unprepared. Recourse was then had to wholesale cutting down of expenses to the crippling of est operations. Money had to be raised at high interest and ordina charges proved to be burdensome the moment receipts dwindl Too often a load of debt accumulated until the banks took pos sion and worked the estates on their own account as cheaply possible, regardless of the consequences Other planters, beset creditors, had to abandon their estates. The outcome is th investors in Europe are afraid to sink money now in Java co estatas unless on conditions highly burdensome to the plante An expert points out in the *Sourabaya Courant* that Java coffee h still a world-wide reputation for excellence. Planters now ha only to keep up that good name to find safety. With choice s and judiciously economical management, there is every chance well-cured Java coffee commanding such prices as will pay han somely. But this depends upon care not to grow inferior so brought to market under brands of good repute. Another conditi for success is that the planter should, as much as possible, be ma ger as well, and should on no account allow those who lend h capital to have any voice in the management or in contracting supplies. Other evils to be guarded against are that of going useless expense on buildings and machinery before there is a prospect of a crop; and that of allowing too young trees to be Too often coffee has been grown on bad ground for the purpose rearing sickly and weak plants, because they bear sooner th strong healthy ones. The argument is that there must be a cr three years after planting, otherwise the capital sunk would unremunerative Berries from these weaklings produce still wea er plants in the nurseries. The result is that degeneration a weakness characterise much of the Java coffee grown, and t plants themselves are stricken with disease.

THE COFFEE TRADE IN AMERICA.

Coffee, at one cent a cup, as sold at the St. Andrew's coffee stan and coffee, at Delmonico's or Sherry's at twenty-five cents per cu marks, says the *American Grocer*, the popularity of the beverage a the favor in which it is held by all the people, or—as some are wo to say—the masses and the classes.

Coffee has become the favorite National beverage, outranki its greatest rival beer, being a cheaper and less harmful bevera

That epicure of all epicures, the late Theodore Child, author the charming work, entitled "Delicate Feasting," says:

"Tea, coffee and tobacco come under the heading to whi scientific men have given the name of paratriptics. The dema for them is based upon their power to prevent waste in the bo so that by their help and stimulus men can do more work a endure more privation with a smaller amount of actual food. T coffee and tobacco are not food, although temporarily and contin ously they supplant it. The physiologist, Moleschott, calls th the "savings banks" of the tissues"

The physiological or dietetic value of coffee is indisputable; b as with every other article used by man, it may disagree with th whose physical condition is not normal. Every man is, as regar food and drink, a law unto himself, and must find out and use th substance or beverage which best agrees with him.

There are millions ready to confirm Lord Bacon's statemer "They have in Turkey a drink, coffee, which comforteth the hea and aideth digestion."

Coffee, when made into an infusion which gratifies the pala causes one to thank God for the sense of smell and bless Him fo gift which adds to physical comfort and the pleasures of the tab And so it comes about that memory retains the delights that thro a halo about the perfect cup of coffee, to make which requires high grade of the bean and that it be fresh roasted, fresh grou and fresh made. Then it is that the gentle stimulant acts upon t heart, warms the body and makes one grateful for life and innumerable gifts.

The United States is the largest user of coffee of any nation the world, as regards imports, but is behind Holland in its p capita use. Last year the net imports were 801,750,146 poun which yielded 673,470,123 pounds of roasted beans, equivalent 1,346,940,246 gallons of infusion, or 18·2 gallons per capita. T per capita import of the green bean was 10.8 pounds.

Grinding is also quite an important process. If ground t coarse, the strength of the coffee is not readily extracted, and will not be strong enough; if ground too fine, it is apt to be made Here again the happy medium is best It should not be grou until just before it is made, as, after grinding, the aroma passes

very rapidly. Hence it is best for every family to have a portable coffee-mill and grind their own coffee. Where this is not practicable, the ground coffee should be kept in a tightly-closed tin can or glass jar.

One necessity for the making of good coffee is the finest coffee bean. Of these there are many different varieties, chief among which are those produced in Brazil, commonly known as Rio coffee; that which comes from Java; and the Arabian coffee, known as Mocha. The Central American growths are of high grade, and now constitute an important part of the supply. A blend, or mixture, of Mocha or Java is in high favor, although there are many other favorite blends and mixtures suited to different tastes. Some varieties of coffee are strong and somewhat acrid in flavor, and others are milder and richer; and there is great scope for an expert in coffee to produce good effects by careful blending and roasting. Naturally wholesale merchants, doing a large business in coffee, employ the most expert blenders and roasters, and produce the best average results, although any careful and intelligent person having the proper facilities, and who can give the necessary time to it, can, with a little study, perform this delicate operation very well.

The world's yearly supply for three years past has averaged 15,346,674 bags; for this year is estimated at 16,000,000 bags. The Republic of Brazil is the colossal producer of coffee, furnishing 70 per cent of the world's supply. * * * * * *

Thirty years ago the bulk of the coffee reached consumers in the United States in the raw bean; but, gradually, after the Civil War, the Southern and Western States adopted the custom which was almost general in the Northern cities of buying the bean roasted.

Green coffee now ranges in price from 4½ cents to 35 cents, the wide range being due, in a large measure, to the popular prejudice for certain growths, rather than to differences in intrinsic merit between the coffee of different countries. In other words, it is possible to buy for 14 to 18 cents a green coffee that has as good, if not superior, drinking qualities to coffee for which buyers will pay 25 to 35 cents per pound. This condition of the market affords roasters unusual opportunity for making fine blends and carrying a business at a good profit. The result has been a very rapid increase in the number of roasting establishments and a competition which insures the consumer a good article. Never was coffee so popular a beverage as now, nor its use increasing so fast.

ENGLISH IMPORT DUTY ON TEA.

The annexed correspondence has been issued by the Indian Tea Association, Calcutta, for general information, in continuation of the General Committee's letter No. 463-O., of 17th August, to the Secretary to the Planters' Association of Ceylon, which has already been published:—

From the Planters' Association, Ceylon, to The Secretary, Indian Tea Association, Calcutta, dated, Kandy, 11th September 1899.

SIR,—Your letter No. 463-O, of 17th August. In forwarding you the resolution adopted by this Committee, I am instructed to say that they are not yet convinced that the time is ripe for a movement in favour of the abolition or reduction of the duty on tea in England, or that the abolition is in the best interests of the producers. They will, however, continue to collect information, and would be glad to know on what figures you base your statement, "that it is admitted that reduction of duty in the past has tended to increase consumption as a whole, and that further reduction would have a similar effect."—Yours faithfully, W. D. GIBBON, Acting Secretary, Planters' Association, Ceylon.

RESOLUTION.

"That the Committee, having considered the letter of the Indian Tea Association, deem it inadvisable to take action in the matter at present.

INDIAN TEA ASSOCIATION.

No. 634-O. Royal Exchange Building,
Calcutta, 24th October 1899.

The Acting Secretary,
The Ceylon Planters' Association, Kandy.

ENGLISH IMPORT DUTY.

DEAR SIR,—The General Committee of the Indian Tea Association direct me to acknowledge receipt of your letter of 11th September on the above subject, with which you forwarded a copy of the following resolution adopted by your Committee, *viz.*:—

"That the Committee having considered the letter of the Indian Tea Association deem it inadvisable to take action in the matter at present."

2. Your letter, and the resolution, were discussed at the last meeting of the Committee and they noted that you are collecting further information on the subject. They hoped that, in the light of that information, when obtained, your Committee would see their way to participate in a movement in favour of reduction or abolition, and to give the weight of their support to the views expressed in my letter of 17th August.

3. You asked to be furnished with the statistics upon which the General Committee based their statement that "it is admitted that reduction of duty in the past has tended to increase consumption as a whole and that further reduction would have a similar effect." When writing the letter of 17th August, the Committee were under the impression that your Committee were in agreement with them in regard to this statement. Their reason for so thinking was because, in a speech delivered on the 17th February, in the present year, the Chairman of your Association made the following remarks:

"They knew, and they felt undoubtedly, the reduction of duty in past years had tended to increase consumption. Figures that were before him were most encouraging. Going back to 1837, when the Queen came to the throne, only 30,000,000 lbs. of tea were consumed in the United Kingdom, and the duty was 2s. 1d.; in 1887, the duty was 6d. and the consumption was 183,000,000 lbs.; and in 1897, ten years later, the duty was 4d, and the consumption 232,000,000 lbs He did not mean to say that that was entirely due to the reduction of duty, because the increase in population had to be taken into account, but it was quite sufficient for his argument that the reduction of duty tended to increase consumption."

In view of these remarks the Committee concluded that they were justified in assuming that your Committee admitted that consumption was increased by a reduction of duty. In response, however, to the request now made they have instructed me to annex to this letter a table, which gives, in a concise form, the figures upon which they based their statement. But before remarking on this table I am to offer a few comments on the statement itself. The Committee regard it as merely an application of a well-known economic law to the case of a particular commodity. The law briefly stated is that, when the price of a commodity falls, the demand increases, and conversely when the price rises the demand is lessened. An indirect tax, such as an import duty, on any commodity may be correctly regarded as a part of the price paid for that commodity by the consumer. Therefore a reduction in duty necessitates a fall in price. This law is admitted by all economists; it is clearly laid down by Professor Nicholson, of Edinburgh University, in an essay on "Value," as follows:—

"As the price of any article falls, other things remaining the same, the quantity demanded increases, and conversely as the price rises the quantity demanded decreases. A very good example of this law is found in the remission of taxes. The repeal of a tax leads to a fall in price and the fall in price is accompanied by increased consumption. Conversely it has often been found that to increase the amount of a tax does not increase the revenue from it because the demand for the article falls off."

The converse of the proposition now under discussion was also stated by Mr. John Stuart Mill in his work on the "Principles of Political Economy," as follows: "The higher price necessitated by the tax [an import duty] almost always checks the demand for the commodity." Another eminent political economist, Professor Leone Levi, remarked, as far back as 1860 in reference to tea, that "the revenue from tea may be expected to increase considerably, so long as the present limits are maintained; and should the finances of the nation admit the realization of the reduction to 1s. per lb., the increase of consumption, which is certain to follow, will cause the revenue speedily to recover, if not to exceed the present amount." (*On Taxation*, pp. 72, 73.)

4. That tea is no exception to the operation of the law referred to in the last paragraph is, in the opinion of the Committee, conclusively proved by the table appended to this letter. Between 1815 and 1820 the duty was practically 4s. per pound—the highest rate which has obtained during this century. The average consumption per head of the population during the same period was 1 lb. 4oz.—the lowest level reached during this century. That is to say, the lowest rate of consumption coincided with the highest rate of duty. From 1824 to 1865 the reduction of duty may be said to have been almost progressive; the price of tea in bond was also almost pro-

gressively falling. The inclusive price paid by the consumer was thus appreciably lowered and the consumption per head rose consequently from 1 lb. 4 oz. in 1824 to more than 2½ lbs. in 1865. In the latter year the duty was reduced to 6d., and by 1870 consumption had reached 3·81 lbs per head of the population From that time to 1890 consumption was stimulated by the fall of the price in bond, which of course lowered the price paid by the consumer. On the 1st May 1890 the duty was reduced to 4d. per pound. The result was an increase in consumption from 4·66 lbs. per head in 1889 to 5·36 lbs. in 1891, and 5·4 lbs. in 1892 It was in view of these facts that the Committee's statement was made, and they hold that it is indisputable that the reductions of duty, which have been effected since the days when it stood at 4s. per pound, constitute one of the main causes of the enormous increase in the consumption of tea in the United Kingdom.

5. It would be easy to cite instances of other commodities, the consumption of which has been likewise stimulated by the reduction of the import duties levied upon them. Up to the year 1846 the consumption of sugar per head of the population of the United Kingdom scarcely exceeded 17 lbs. The duties on foreign sugar were at that time, owing to the anti-slavery policy of the Government, as high as £2 3s. per cwt. In 1846 they were reduced by nearly one-half; consumption immediately rose to 22 lbs. per head. In 1848 the duties were brought down to 10s. per cwt; consumption was further extended to 34 lbs. per head. After 1848 the duties were progressively reduced, and finally abolished, with the result that at the present time the consumption per head of the population in England is about 80 lbs.

6. From the foregoing your Committee will doubtless agree that the statement made in the letter of 17th August was literally correct, in so far as reductions in the duty in the past are concerned. The opinion that the effect on consumption of any future reduction, or of abolition, would be similar to the effect of past reductions is clearly based upon a fair assumption, supported as it is by recognised economic principles, and by the experience of the past. The Committee, therefore, can come to no other conclusion than that embodied in the statement quoted in your letter. The probable relative effects of reduction or abolition were dealt with in the previous letter, and they do not now propose to make further reference to them In conclusion they trust that your Committee will again give the whole question their most careful consideration, and that by a convenient opportunity you will favour this Association with a more or less detailed expression of their views.

Yours faithfully,

J. TAYLOR,
Acting Secretary

COFFEE PLANTATIONS IN MEXICO.

Five years ago the only coffee grown on the Isthmus of Tehuantepec was that raised by native Indians for their own use. To-day the thing is changed, and in five years more the Isthmus of Tehuantepec will probably be the biggest coffee exporting section in the Republique of Mexico.

There are no less than 25 coffee plantations established there, and as many smaller ones. Some of these are owned by corporations, and are probably the largest coffee plantations in Mexico. Others are owned by private individuals, but they are all doing well. Some of these plantations have their own steam-boats or naphtha launches running on the respective rivers on which they are located. Others are on the line of the railroad All have direct transportation to European and American markets. Large substantial buildings, improved coffee machinery plants, and sometimes saw mills and sugar mills, mark the location of some of these plantations, and, radiating in different directions from their active centres are the villages of peons employed in work.

At first there was some fear about the success of coffee raising on the Isthmus as an investment, but now this is dispelled. The first coffee plantations established there are now bearing coffee and yielding returns, and, from actual tests, the production, per tree, is greater than in other parts of the country, and very much more than it is in Brazil.

The best harmony prevails among the various plantations on the Isthmus, and all seem to be working together to make that the greatest coffee producing section in Mexico. They will likely succeed in this, as the Isthmus is endowed with the proper conditions of soil and climate for growing coffee.

In the Coapiloloya district of the Isthmus there are five large plantations, all connected by telephone, though their distances vary from 3 to 15 miles from each other. One of these plantations "El Remolino," owned by Mr. F. A. Macfarland, of Denver, Colo., was the first American coffee plantation established on the Isthmus of Tehuantepec. This plantation is now harvesting coffee. Mr. Macfarland put in his first coffee machinery last year, but finding it rather small to handle his coming crop, is now adding to its capacity. Two of these plantations belong to large American companies. On one of them they are now erecting a plant that cost $50,000, gold, in the United States. Some of the planters in this section are putting in the rubber as it is now considered even more profitable than coffee.

The well known Cockrill plantation is in the San Juan district of the Isthmus. It is surrounded, at various distances of from 5 to 25 miles, by other flourishing plantations. A hungry *gringo* will not starve if lost in this section of country, as he will be sure to stumble over some fellow countryman's plantation before going very far. Planters here are adding sugar-cane to the crops. One small 40 acre tract of coffee in this district produced last year an average of five pounds of coffee to the tree, one tree producing as much as 37 pounds of green coffee in the pulp.

It is said that Americans are going to do with coffee in the Isthums of Tehuantepec what they have done with fruit in California, that is, improve its quality and increase the production per tree. Their system of planting and manner of cultivating is certainly far ahead of the old local methods, and better results are naturally expected. No such an example as the tree cited above has ever been known there before.

Mexican coffee commands a higher price in New York than all others, except probably the reputed Mochas and Javas, but it is believed that American grown coffee in Mexico will excel even these brands in future.

Probably the most interesting coffee district in the Isthmus to visit is the Santa Lucrecia district. It is the most accessible, and can be reached by rail or river. Where thousands of dollars have gone into the development of plantations in other districts, tens of thousands have gone in here. It is estimated that $2,000,000 have already been spent in the development of coffee and rubber plantations in this district, and there are certainly evidences of it It is here where the famous "Dos Rios" Co. has over 10,000 acres of land under cultivation and development. The town of Dos Rios which is now quite an important little place, with a settlement of American and Mexican inhabitants, was founded by this company four years ago. The business done by the various companies in this district has given Santa Lucrecia its importance as a station on the Tehuantepec Railroad. This station handles more freight and passengers than any other station on the railroad. The Dos Rios plantation has about 2,000,000 coffee trees planted. Their first crop was gathered last year. They are now putting up probably the largest coffee machinery plant in the country to handle their future crops. One would think that he is in the famous "São Paulo" district in Brazil to visit this section of the Isthmus.

The Amate plantation, owned by a St. Louis Co., comes next, in this district, in importance of size and age. It covers an area of 20,000 acres of land, and has fincas, planted in coffee, covering several square miles in extent. The American ambassador's family and the Belgian minister spent a few weeks on the plantation last March, as the guests of the plantation manager. Many interesting horse-back rides, in which the Misses Clayton displayed remarkable courage in horsemanship, were taken over the vast tropical woods and coffee fincas of this plantation. This company has a steamboat and a naphtha launch running on the Coatzacoalcos river for its own private use, and, when pleasure is combined with business, the enjoyment of a trip on this beautiful river is indescribable. Probably the most notable improvements in buildings, &c., going on at present on the Isthmus are right here at this plantation. Besides a large number of modern *peon* houses and a warehouse that they have just put up, they are completing a residential building, which is built on the order of the Southern plantation homes in the United States, and gives the country an appearance of the civilisation and comforts Americans are used to. One does not feel that he is anywhere near the wild jungles and trackless wood of the tropics when he is entertained in some of the homes of those hospitable tropical planters. The Amate is also putting up an American wind-mill and steel tank with sufficient capacity to furnish all its establishment with running water.

In fact Americans are making the Isthmus now a place for re creation and pleasure, as well as the place for getting rich. Comfortable homes are being built in all directions, and coffee fields are filling the air with a fragrance that is refreshing.

Besides the two above mentioned plantations in the district of Santa Lucrecia, there are the "Columbia," the "Las Perlas," the "Oaxaca," the "Tecolotepec," the "La Puerta," the "Ubero," and others, all owned by American companies or private individuals from Chicago, St. Louis, Kansas City, and Indianopolis, and all connected by wire with Santa Lucrecia and the world.

The Hearst estate of California has recently purchased a very large tract of land in this district, and surveyors are now at work dividing it up into small tracts for plantations.

The railroad that is to connect Santa Lucrecia with Cordova, and give this section direct rail communication with Mexico city, is rapidly being built. It is believed that it will be finished in eighteen months.—*Mexican Herald.*

INDIAN AND CEYLON TEA.

We append the Indian Tea Association's Monthly Return of Sailings and Daily Customs Entries of Tea from Calcutta, and Return of Exports of Ceylon Tea for four years up to 10th October 1899 :—

THE FUTURE OF THE CEYLON TEA INDUSTRY.

The London correspondent of the *Ceylon Observer* has written at considerable length on this subject. We give below copious extracts from his remarks, so that our readers may have a fair idea of the statements made and the opinions expressed. Omitting many remarks, we quote as follows :—

I have had the opportunity of discussing this all-important question during the present week with several representative authorities, all more or less interested in the welfare of our staple industry and the important trade based upon it. First, it is cheering to remark on the general confidence maintained in the future of Ceylon and its "tea." The check given to over-production by t enhanced rupee, and the recent fair supply of labour have und edly strengthened the position; while the disastrous experi in Darjiling, affecting not a few well-known "gardens," has o more attracted attention to the wonderful exemption of the pla ing districts of Ceylon from earthquake, cyclone or hurrica so far tended to enhance the estimation of plantation property our island.

On the other hand, I find myself always asked "What abo these

BLIGHTS,

of which we hear so much in the papers and in correspondence late"? Now my reply has been uniformly and honestly re-assurin for while there was occasion at first to rouse the attention of plant in certain districts to the need of "watching and working" towar checking the evil, I have had placed before me reliable eviden that not a few are inclined to attribute to "blight," injuries or d coloration of their tea-bush leaves, due to the puncturing of insec to climatic, local and temporary causes. Just as some men at t outset refused to recognise the presence of the grey blight, ev when pointed out to them,—so, of late, the other extreme is seen many superintendents discovering blight in every trivial attack minor enemies from which no product is free. I do not for a m ment say that there are not, in some parts of Ceylon, attacks—a serious attacks—of what Dr. Watt points out to be the worst enem of our brethren in Assam; but I do maintain that they are far le widespread than has been recently supposed; that they are oft very temporary and due to causes (such as too long delay pruning) easily overcome; and that the time has come now f planters to be very careful in their observations and cautious reporting "blight," before they are fully convinced that the re "Simon Pure" is amongst them.

The next division of my subject for the present should be t continued progress made in opening

NEW MARKETS

and, in this connection, I am pleased to read Mr. Renton's encou aging *ad interim* report; and no less to remark on the important fa brought out by your Hewaheta correspondent that coffee, even its present unprecedentedly low price, is by no means so econom a drink as tea, if the test be the quantity of enjoyable, or avera beverage got from the same weight of each product. Discussi this point with a tea merchant in the city interested in t American market, he pointed out that good coffee could be sold the United States at one-fourth to one-fifth the price of good t (in view of the duty on the latter and other causes); but I at on replied that, even taking this somewhat extreme comparison, t gave *eight* times the return that coffee did, in a reliable refreshin beverage! This fact must be pressed home on practical American as well as on all careful housekeepers on the Continent of Euro (where their name is legion).

But now I come to another phase of my subject: the arrangemen connected with the receipt, handling and selling of our staple pr duct in this,

THE GREATEST TEA MART IN THE WORLD.

The agitation over the one-pound draft, although it may be thoug by many to have ended abortively, and even disastrously, for t time, has undoubtedly resulted in one great good, by bringing full light of enquiry and criticism to bear on all the arrangemen connected with the importation and selling of tea, and some of t details, I find, were quite unknown to men of not a little experien in the trade. The whole question of warehouse arrangements now under the careful consideration of the Joint Committee Indian and Ceylon tea reprsentatives and not a little novel i formation is likely to be obtained as to the process attendi "overtakers,"—surplus tea not put back in chests—*not*, as alway supposed, because of careless re-packing preventing its admissio but under a regularly adopted system which must have be worked to the great advantage of some unknown parties, neith planters nor merchants. Then, again, the strange fact is likel to be brought out that certain Indian Tea Companies, havi protested, and insisted on a strict account of all their tea, hav not suffered, like the bulk of their brethren, from this overtakin arrangement!

The very considerable decline in values, as compared with, sa ten years ago, is doubtless mainly due to increased productio This increase was induced by the steady fall in the sterling valu of the rupee; and, so long as the fall continued, it compensate

* Exports to United States lbs. 644,495
Do. to Canada ... ,, 500,056

growers for the lower range of values established. But it would be well for producers to consider what other influences may have contributed to this lowering of values. The practice of putting up to public auction all Indian and Ceylon teas, as fast as they arrive, regardless of the immediate requirements of the trade, has undoubtedly (in the opinion of good authorities) had, very frequently, a depressing effect on prices from which recovery has been extremely slow. This it is now sought to overcome by the formation of a Committee to regulate the offerings of Indian teas, which certainly is a step in the right direction; but unless the members of the Regulating Committee are able to gauge fairly closely the extent of the current consumption of the article, and unless the whole of the Indian importers consistently back up the Regulating Committee, it is to be feared that the movement may not prove as full and complete a remedy as is desirable. It is pointed out to me that, during the past ten or twenty years, very important changes have occurred in the methods of the

HOME DISTRIBUTING TRADE.

Formerly, I am told, when the China leaf held the market, the dealer was practically the only purchaser for the home trade, the "Blender to the Trade" being unknown. And it is of importance to bear in mind that nearly the whole of the China tea sold in the London market passed by "*private contract*"—very little, and that only to close up shipments, etc., being offered at auction. The dealers in those days carried very considerable stocks; and as they were able to obtain reasonable profits on the basis of Mincing Lane quotations, they had no inducement to lower market values. With the present-day wholesale blender and packet man the case is quite different. He has his standard blends, with fixed prices so far as his customers are concerned; and inasmuch as his purchases at auction cannot be followed, as can those of the dealer by his grocer clients, his profit is the greater the more he can knock down Mincing Lane values. We have also, apparently, to accept the fact that the blender and packet man have been eminently successful in cutting into the trade of the old-time dealer and family grocer, for whom the grower may be excused for having as great a reverence as has the modern buyer for the old-established "pound draft"! The London Tea Market is dominated by a few—a comparatively very few—large wholesale blenders. There are, of course, numerous other buyers, for the trade of the dealer has not yet been completely wiped out; but the possible operations of these few very large buyers is an additional and hampering element which all others have to take into consideration. The great influence on the market of the large buyers is also felt by sellers of Calcutta or Colombo-bought teas, as also, it is asserted in nine cases out of ten, by growers who do not accept the best bid at auction, and who "take out" any break. The general policy, it is alleged, is, as far as possible, to render the character of the auctions "without reserve" sales, and to discourage all teas not put up on growers' account, presumably because a grower is more squeezable than an importer who has a merchant's cost to cover and profit to fight for. The essence of public auction, of course, is that there should be free and unrestricted competition for the article exposed for sale; and anyone with any knowledge of the subject, I am assured in some quarters, can hardly contend that these conditions apply to the tea auctions in Mincing Lane, except on the rare occasions when any particular grade of tea may be in very short supply.

The great obstacle in the way of reverting to the system of "private contract" is the large number of breaks now put on the market. To some extent this might be improved upon without much trouble on the estates, but not to the extent necessary to admit of the change indicated, unless the whole system of packing teas for the London market be revised. Breaks of *at least* 200 to 300 chests, *i.e.*, of each *grade* of tea, would have to be the *general rule*, and the larger the break the better—especially of the principal grades which might run up to 500 or 600 chests. Such breaks could only be secured by bulking together teas of the same character from different estates, and this could only be undertaken by large companies or combinations of proprietors. Such a change would be very difficult of arrangement, except perhaps gradually.

So long as sales by public auction cannot be avoided, it is undoubtedly to the seller's advantage to place his teas on the market where they are most likely to meet with the greatest competition, and the Calcutta and Colombo markets would seem to answer this requirement. Several of the large London buyers have representatives on these markets, and in addition there are buyers for direct shipment to Australia, America, Russia and other parts of the world; while there are also merchants operating for the Mincing Lane Market. But it is pointed out these latter are at present at considerable disadvantage owing to the action of the large buyers in London. It is, however, not going too far to say that, if the whole of the Indian and Ceylon crops were respectively sold in Calcutta and Colombo, the competitions of merchants prepared to take merchants' risks would be a most important factor in counteracting the overweighting influence of the large London buyers, and that the London stocks of tea, not in grower's hands, would be very much more generally held, which could not fail to have an advantageous effect on prices.

As a means, therefore, of improving the grower's position in the matter of marketing their produce, it is now suggested for consideration:—(1) that a more extended use be made of the Calcutta and Colombo markets, especially by gardens unable to pack large breaks; and (2) that for London very large breaks should be made up wherever possible, and be placed on the market for sale by *private contract*.

SLEEP WHEN WORK IS DONE.

During the late summer (1896) I passed several weeks in a foreign city nearly 700 miles further south than London. We had about ten days intense heat, and for six nights, when it was worst, I do not think I slept as many hours altogether. The resulting nervous collapse was simply awful. My brain reeled, I could neither understand, nor do anything rightly. I walked, as the good Book says, "in a vain show." What a blessed thing is sleep; how destructive, how killing to lose it.

In healthy sleep the nervous system is inactive—more especially that of the brain and spinal cord. The body lies quiet, the muscles relaxed, the pulse slower than when we are awake, and the breathing less frequent but deeper. Then nature—wise keeper of the House of Life—proceeds to renew the energies expended through the day. To miss this renewal, even in part, is to tread the edge of insanity and look into the mouth of death.

"Methought I heard a voice cry, 'Sleep no more; Macbeth doth murder sleep!" So said Macbeth himself; but there is a power which murders more sleep than ever did Duncan's assassin; and to *that* Mrs. Beattie alludes when she says of her daughter, "*She got no sleep.*"

"In May, 1891," writes the lady, "my daughter Letitia fell into a low, weak condition, and could not get up her strength. She had no appetite, and what little food she took gave her great pain at the chest and sides. She *got no sleep at night*, and became very nervous and low-spirited.

"As time passed by she grew weaker and more feeble, and we thought she would never get better. A doctor attended her, but none of his medicines seemed to suit her case, and for two years she continued to suffer.

"One day she read in a book about Mother Seigel's Curative Syrup and what it had done for others. She got a bottle from Mr. Nicholls, chemist, Donegal Place, and after taking it began to improve, being able to eat, and her food agreeing with her. After having used this medicine a short time she was strong and well as ever, and has since been in good health. For a long time I myself suffered from weakness and indigestion, and seeing what good Mother Seigel's Syrup had done I took it and was completely restored to sound health. You may use this statement as you like. (Signed) (Mrs.) Mary Beattie, 23, Trinity Square, Belfast, August 14th, 1896."

"In the early part of 1894," writes another, "I began to suffer from indigestion. I had a poor appetite, and all food gave me pain at my chest and a gnawing feeling at the stomach. No matter how light the food I took I had pain and sick headache.

"For over a year I was tormented like this, when Mr. John Weir, living in this place, told me how he had been cured by Mother Seigel's Syrup, and recommended me to try it. I did so, and soon all pain left me, and I have since enjoyed good health. I know many persons residing in this district who have been benefited by taking the same medicine. Often in my shop I hear persons say what it has done for them. You are at liberty to publish this letter. (Signed) Alexr. Wilson, General Merchant, Castlewella Newcastle, Co. Down Ireland, Aug. 15th, 1896."

Indigestion or dyspepsia destroys the power to sleep by starving, and thus weakening, the nervous system. Indeed the whole body

starves, and is thrown into profound disorder. Food may be taken into the stomach, but, as people constantly say, "It does no good." No; but in a sense it does harm. Fermented, soured, undigested it develops poisons which act upon the system somewhat as a pestilence does upon a community. Flesh is lost, strength gives way to trembling weakness, courage is supplanted by fear, and life is dreary and desolate. That Mother Seigel's Syrup should be able to cure a disease so common and so terrible is reason for gratitude to us all. For the healthy—work and sleep.

MARKET REPORT.

Per Mail Advices of 20th October 1899.

COFFEE.

The London Commercial Record says:—A generally stronger tone prevails in this market, and a considerable proportion of the supplies offered at auction was disposed of. Prices shew much irregularity, and although East India has been more freely taken no improvement in value can be reported. On the other hand, Foreign descriptions have been in good demand, especially at the close, prices shewing an advance of 2s per cwt. "Futures" have been active, and yesterday there was much excitement on the rumour of plague at Santos, and an advance of 2s per cwt. took place, but though part of this improvement was lost in the later hours prices for the week shew a substantial rise. We quote:—

London ...	Santos ...	December delivery ...	29s. 9d.
New York ...	No. 7 Rio...	„ „ ...	5·10 cents.
Hamburg...	Santos ...	„ „	29½ pf.
Havre ...	Santos ...	„ „ ...	35½ francs.
Holland ...	Good ordinary Java ...	...	29 cents.

At the Dutch Trading Company's public sale on Tuesday, in Rotterdam, 20 cases 26,113 bags Java offered and sold at generally higher prices, good ordinary selling at 29c, against 26½c valuation, and 26c last sale. The following are some of the particulars:—

Lying in Rotterdam.

Oct. 17 ...	4·70	4·70	4·85	4·95	5·

TEA.

CHINA.—Common and ordinary qualities experience a good d mand and bring fully valuations, but better class grades are poor request. Auctions have comprised 4,920 packages during t week the bulk of which sold as follows:—New season's: Scent Caper 6½d to 8d, Moning 6½d to 8½d, Scented Orange Pekoe 7¼d 11¼d, Pekoe Congou 7d to 8d, Lapseng Congou 6½d to 6¾d, Formo Oolong 8¾d to 10¼d. Old season's Oolong 5½d to 11½d. Scent Gunpowder 6¼d to 1s 4d, Young Hyson 7¼d to 8½d, Foong Mee to 1s 0¾d, Sow Mee 7¾d to 1s 2¾d per lb.

INDIAN.—A similar quantity was offered publicly, viz., 48,3 packages, against 48,500 in the previous week, and 48,300 packag in 1898.

Although not much change in prices was noticeable, a steadi feeling prevailed, partly due to the firmness of some importers w were not disposed to make further concessions in face of the hea duty payments (which indicate that the consumption of Tea gene ally throughout the country is on a satisfactory scale), and co paratively lighter shipments recently advised. On the whole go liquoring invoices were taken up freely at fully prior quotatio but when there is a falling off in strength, as was the case in so of the Assams, competition was not so keen and they went easi particularly Pekoes from 7½d to 10d per lb. Arrivals from Cach and Sylhet, also a few of the Dooars lately to hand, marked impro ment in quality and were of a more useful character than the p ceding consignments from the same gardens, while, on the oth hand, Darjeelings were in many instances inferior.

For 36,000 package on Estate Account 8¾d was obtained, vers 8¼d per lb. for 34,300 packages and 9¼d per lb. for 31,800 packa in the two foregoing seasons.

Telegrams from Calcutta state that entries for export to the Uni Kingdom for the first fortnight of the month were 7,500,000 l while for the corresponding period of 1898 they were 10,300,000 l the totals from 1st April being 83,192,000 lbs. and 80,217,000 l respectively, thus reducing the excess which on the 15th Septem was 6½ million lbs. to about 3 million lbs.

CEYLON.—Lighter sales were held, amounting to 25,200 packag On the 10th instant 29,400 packages were brought forward, a 24,500 packages a year ago.

There was brisk bidding for nearly all common to fair descriptions at slightly reduced range of value current on the Tuesday before, but where flavour was less desirable, lower rates had at times to be accepted. The demand from abroad is somewhat slack at the moment, and in consequence Medium Pekoes and Orange Pekoes were here and there neglected. Choicest lines commanded attention though there was considerable irregularity in the figures paid for them.

The average remains the same, viz., 8d per lb. On the 19th October 1898, it was 8¾d per lb.

Colombo telegrams give shipments to Great Britain from 1st to 15th instant as 4,700,000 lbs., and the estimate for the month 8,250,000 lbs.

JAVA.—In the absence of auctions there is nothing to report. About 2,000 packages, however, are advertised for the 26th instant.

Deliveries —The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, viz. :—

	Lbs.
From 1st to 17th Oct., 1899	11,387,195
Do. do. 1898	9,965,622

} Total 73,820 packages were offered in public auction this week.

An encouraging increase has taken place in the direct exports of Ceylon Tea to markets outside the United Kingdom during the last nine months. For many years past rapid progress has now been made in these shipments, viz. :—

1899.	1898.	1897.	1896.	1895.	1894.
Lbs. 19,194,104	17,037,941	11,911,213	10,053,323	8,813,641	7,006,167

Australia and Russia have each taken about a million lbs. more than during the corresponding period of last year, while America also shows an important increase. The exports to France, although small, have shown steady progress each year.

DISTRIBUTION OF TEA EXPORTS FROM CEYLON FROM 1ST JANUARY TO THE END OF SEPTEMBER.

INDIAN.—Auctions passed without material change on last week's rates, the market as a whole continuing steady; the total up for next week is distinctly smaller, only 39,588 packages being advertised at present. The time of year is now coming on when the work of the Regulating Committee may do much good in alleviating the physical strain upon buyers and the financial pressure upon the trade which has frequently occurred at this period.

The official wire from Calcutta gives exports to U. K. for first half of October as 7,500,000 lbs., against 10,300,000 lbs. same period last year, making the total quantity from 1st April to date 83,192,000 lbs. against 80,217,000. The following averages are worthy of note :—"Margaret's Hope," 1/5½; "Runglee Rungliot," 1/3¾; "Assam Co Doomur Dullong," 1/2¾; Budla Beta TCo K," 1/2.

Week's av. of Tea sold on Garden Account 1899, 36,377 pkgs., av. 8·69d. 1898, 34,382 pkgs., av. 8d.

Total Tea sold on Garden Account 1st June to date 1899, 389,265 pkgs , av. 8·58d. 1898, 367,064 pkgs., av. 8·76d.

CEYLON —The auctions, although still heavy, showed a reduction of over 4,000 packages on the quantity brought forward last week, while 22,446 packages are advertised for next week. The strain placed upon the market by recent heavy supplies has been great, and this week showed again an easier tone, prices giving way fractionally for nearly all grades, except the few choice liquoring descriptions. Private telegraphic advice from Ceylon quotes shipments to United Kingdom for first half of October as 4,700,000 lbs., and the quantity available for the month as 8,250,000 lbs. The following averages may be mentioned :—Nuwara Eliya T Co.'s gardens "Concordia" and "Park" 1/1½ and 1/0½, respectively ; and "Madulseema T Co. Mahadowa," 1/1. Average for week 7·90d., against 8·46d. in 1898.

Ceylon Tea sold on Garden Account 1st January to date 1899, 867,290 pkgs., av. 7·96d. 1898, 921,265 pkgs.. av. 7·67d.

JAVA.—No Java were brought forward, but 2,054 packages are advertised for sale in London next week.

Bank Rate 5 per cent. Exchange on London three months sight : —Calcutta 1/4⅜. Colombo 1/4⅜.

COCOA.

An easier tone prevails in this market, although the difference in values is but small. Auctions on the 17th instant presented 2,436 bags, barely 600 bags selling. Of 496 bags Trinidad, only 20 bags good sold at 72s. 132 bags Grenada were quitted at 64s to 66s for good to fine, being about valuations. 74 bags common Jamaica found buyers at 60s 6d, or about last sales' rates. 2 bags Dominica realised 60s 6d. Of 705 bags Guayaquil, 60 bags pickings and sea-damaged sold at 54s to 57s. 113 bags Bahia, 12 bags Surinam and 36 bags Venezuelan passed the hammer unsold. Of the goodly supply of 1,732 bags Ceylon brought forward, 300 bags sold at rather below expectations—72s for fair bold mixed, 66s for middling greyish, 51s 6d to 63s 6d for common to good red small, and 55s to 61s for common Native.

Private transactions include 50 bags Trinidad—dark at 68s, middling to good 71s to 73s; 100 bags African at 61s, 100 bags Bahia at 60s, and 1,250 bags Guayaquil—part greyish to fair Caraquez at 65s to 68s 6d.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.

PEPPER.

BLACK.—The market is firm and dearer, with sales of 200 tons Singapore—at 5 9/16d to 5 5/8d on the spot, at 5 11/16d for parcels near at hand, at 5 11/16d September-November shipment, at 5 3/4d to 5 23/32d October-December, at 5 7/8d January-March, and at 5 27/32d to 5 7/8d February-April. February delivery has been sold at 5 13/16d.

At auction on Wednesday 120 bags Penang were bought in at 5 1/4d, for weight 3 lb. 11 oz., dust 5·11 per cent. per gallon. 29 bags good heavy Singapore character sold at 5 5/8d. 405 bags dust sold "without reserve" at 2 1/2d to 3d per lb.

The shipments of Black Pepper for the first half of October compare as follows:—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	60	80	380	430
„ Penang	20		50	
Continent	...	*nil*		30
United States	...	*nil*		70
Total ...		80		530

WHITE.—Is quiet. Of Penang sales have been made on the spot at 8 7/16d, and January-March shipment at 8 5/8d.

Public sales on the 18th instant presented 43 bags Singapore and 69 bags Penang, which passed the hammer unsold.

The shipments of White Pepper for the first half of October compare as follows—

	Tons. 1899.		Tons. 1898.	
U. K.—Singapore	110	250	140	220
„ Penang	140		80	
Continent	...	60		160
Total ...		310		380

GINGER.

COCHIN.—Persistent reports as to the poor quantity and quality of the new crop have been instrumental in creating a speculative demand, and prices have risen materially. There is little doubt that the drought in India must have had a very bad effect on the growing roots, and from influential sources we hear that digging result in only small and lean Ginger being raised. In addition to the poor return, it follows that the crop will be late, and there are no offers to sell c.i.f.

Privately some 2,000 bags have been sold on the spot. Calicut rough sorts 25s to 27s, small ditto 20s, medium and small washed rough, below f.a q., at 25s, ditto rather mouldy and wormy 22s to 23s; also Calicut rough sorts at 27s 6d for February delivery, and Cochin washed, January delivery, at 26s 6d to 27s, and February at 26s per cwt.

At the auctions, to effect sales in decent quantities, it would have been necessary for holders to shade their asking rates. 471 bags 158 bales were presented for public competition, and 43 bags 15 bales (all the latter being cuttings) sold—good brown rough 22s 6d small washed rough, wormy, 22s, dull bold cuttings 17s to 18s per cwt.

JAMAICA.—Is slow of sale. 109 barrels offered and 12 barrels sold at 52s to 53s for common dull, and 51s per cwt. for mouldy ditto.

CINCHONA.

In reference to the Amsterdam auctions to be held on November 2, particulars of which we announced last week, we learn from our correspondent that the total weight of the bark to be offered is 507,936 kilos., consisting of 351,563 kilos. Ledgeriana. 77,132 kilos Succirubra, and 79,242 kilos. hybrid. Since the above a further 560 bales and 25 cases (53,394 kilos.) have been added, making the total now 6,141 packages (561,330 kilos.). The exports from Ceylon for the week ending September 26 were 31,528 lbs., and from January 1 to September 26 they were—

	1899.	1898.	1897.	1896.
Lbs.	524,944	723,482	530,646	881,743

QUININE.

At the close of last week German makers again raised their quotation 1d per oz. to 1s 1d, and on Monday another 1d was added, now making the official quotation 1s 2d in 1,000 oz. lots. Howards now quote 1s 5d for 1-oz. vials, and 1s 4d for 100-oz. tins; Pelletier 1s 6d, Whiffen 1s 2 1/2d. The reason for the advance is that the "bears," who have oversold for October delivery, will now have to pay the enhanced prices, and a good many of them have been covering at from 1s 1 3/4d to 1s 2d. Immediately after the rise the second-hand market advanced daily to 1s 2d, but on Wednesday a weaker tone prevailed, there being sellers of 1s 1d for December delivery.

(AVERAGE FOR ALL INDIA 8·69d.) October 20th.

Please post your next reports to reach Madras on Friday, the 24th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 15*th November*.—*Weather*.—Fine and cool at mornings and nights; some fleecy clouds flitting by lately. Very little east wind so far. Dew copious. *Plant-diseases*.—Leaf-disease may be said to be at an end for the season; coffee is a picture of health. *Crop*.—Big pickings not the rule yet. *Labour*.—Ample. *General Health*.—Good.

FRUITS OF "AGITATION."

The Bill to amend the Madras Coffee-stealing Prevention Act (1878) has been read in Council and referred to a Select Committee consisting of the Acting Advocate-General, the Hon'ble Mr. C. Jumbulingam Mudaliar, the Hon'ble Mr. H. P. Hodgson, the Hon'ble Mr. F. A. Nicholson and the Hon'ble Mr. Gabriel Stokes. With, perhaps, some few modifications, it will soon become law; and we have no doubt that planters will welcome it as marking a very distinct advance on the legislation it is to supersede. It is not its merits we propose to discuss here, however. The Bill has been referred to as a portion of the fruits of agitation effected by planters during the last few years. In supporting the Bill, the Hon'ble Mr. Vijiaragava Chariar said that the coffee-planters of Southern India, and the United Planters' Association of Southern India were to be congratulated on the achievement of their success. So far as the latter Association was concerned, he said, the present Bill was its first victory, and the next and a more brilliant one was looming in the distance. He then passed on to a brief review of the history of the Coffee industry in India, touching particularly upon efforts made from time

to time by planters to bring their grievances under the notice of the authority.

Mr. VIJIARAGAVA CHARIAR was certainly fortunate in the instance he selected to show that planters had gained by, what he termed, their "persistent agitation." Act VIII. of 1878, he explained, declared that any cooly, maistry or other labourer employed in a coffee estate found with green-gathered coffee in his possession, and failing to account satisfactorily for such possession, was liable, on conviction by a Magistrate, to pay a fine not exceeding Rs.500. The coffee-planters now desired that this provision should be extended to all coffee, including parchment coffee and cherry-dried coffee, and they also wanted the provisions to be applied to all labourers, and that this Act, with suitable alterations, should be made applicable to the tea industry. The Government of Madras was at first unwilling to concede these points; but the planters eventually succeeded in convincing them, with the result that a Bill was prepared on the lines indicated above. But when it was submitted to the Government of India for sanction, as regards its penal clauses, they vetoed it, saying that the coffee-planters of South India had already exceptional protection. When Lord ELGIN came to Madras on a tour, a deputation of planters waited on him, and there was a committee appointed by the Government of India to enquire into the planters' grievances. Within the scope of that enquiry tea was not included. That committee recommended that provisions of Act VIII. of 1878 should be made applicable to all kinds of coffee; but as regards the question, whether it should be applied only to coolies, maistries or labourers employed in coffee estates, or all labourers, they saw no reason why it should be extended to others. Such is the history of the present legislation before the Council as related by the honourable gentleman whose remarks we bring to the special notice of our readers. To appreciate Mr. VIJIARAGAVA CHARIAR'S remarks fully, we must read a little further. Why did he support the Bill? He candidly asserted that he did so from motives of self-interest. He obviously thought that planters had set Indians (Congress-*wallahs*, to wit.) an admirable example, and offered them a very valuable lesson. Quoting JUNIUS as saying "facts of yesterday are precedents of to-day, and precedents of to-day are doctrines of to-morrow," he expressed the belief that facts, in regard to the relations between Government and European agitators, might one day become precedents of the Indian political reformer, and such precedents might be matured into doctrines in fullness of time. The success of the persistent agitation of the planters was pregnant with lessons for Indians and fraught with hope; but whether the hopes would be realised in the near future, or in the distant dim future, it was totally impossible for him to say.

This is a view of matters that had not hitherto suggested itself to us, and we venture to hope that the form of flattery that shows itself in imitation will not affect Indian agitators when they study the efforts of planters to bring about reforms. Certainly, something might be gained were they to observe planters' loyal, and unsensational, if persistent, *methods*. But for our own part, we should scarcely apply the word "agitation" to the efforts initiated by District Planters' Associations, and subsequently pressed forward with the help of the U. P. A. S. I. It is something, however, to have such a keen observer as Mr. VIJIARAGAVA CHARIAR remark that a "victory" has been won.

THE CAMERON (AFRICA) DISCOVERY.

The secret is out at last, and it may be briefly stated the discovery made by Mr. Kenneth Cameron, with refere to the prevention of leaf-disease in coffee, consists in the that he has proved, by actual observation, that the suspe spotted bug, usually called the "lady-bird," feeds on coffee berries. Mr. Cameron's advice, as to a remedy, catch the bugs and destroy them; though he does not omi suggest also careful cultivation of the coffee-plant. We the discovery will not benefit coffee-planters in India much; but the information received regarding the African is at least interesting as showing how carefully insect—as as plant—life must be studied by all who wish to be succ ful planters. We feel sure that many of our readers take an appreciative interest in the reprint we give on ano page of the report of Mr. Mahon (Scientific Departmen the B. C. African Administration) on the Cameron discover

COFFEE.

Latest Home reports point to a plague scare as a b factor to the Coffee market. A single case of plague reported from Santos, and the news caused quite a little p in the Coffee market. Prices in the terminal market quic rose until an advance of 1s. 9d. per cwt. had been establis in a few hours. The "bulls" set to work, and from Br come accounts of reduced, if not temporarily depleted, sto from London hints that orders have even been booked for crop Indians! The fact is, no doubt, that prices are so now that very little inducement is needed to set the "bu in motion. Purchases cannot be very risky; but still cau is necessary, under ordinary circumstances, as the statis position of Coffee would still seem to favour the "be rather than the "bull." A London contemporary rep that, in the terminal market, bulls having been greatly creased, more confidence prevails, and buyers of actual co also evince an interest in available parcels, and shipme which lately had been painfully conspicuous by t absence. The more current descriptions of coffee natur feel the drift of the improved interest the strongest, but specialities, such as East Indian coloury sorts, have enjoye demand which, coming at the very fag end of the seaso all the more remarkable and welcome. Spot lots of N gherries, Coorgs, etc., principally A and B size, which some months past, have proved absolutely unsaleable, found buyers at last, and even a small business in new for shipment is reported. It is said that estates in the Sh roys have realised 51s. 6d. c.i.f., Neilgherries have been at 52s. 6d. and Salems at 54s. c.i.f. Continental ports. for favourite Coorgs and Neilgherry crops have been sen both by Continental and London buyers. An improve in the state of affairs could hardly have come at a opportune moment, for it enables consignors of East In sorts to dispose of their old stocks just before the new cr beginning to come in, rendering the outlook, which a time appeared almost hopeless, a great deal more promisi

There is perhaps a little promise also in a display of e prise lately made on the part of some Brazilian Coffee-dea Some go-ahead people in Brazil are co-operating with an established Brazilian merchant in London, to run "Mc Brazilian Coffee Company, Limited." The object of th to develop demand. The Company's factory is situat

178, Goswell Road, E. C., where the coffee is roasted and ground. The offices of the Company are at 116, Bishopsgate Street-Without. It is understood that the Santos commissarios will assist the propaganda by contributing a certain percentage of their coffees for advertising purposes; and every effort will be made to secure for coffee in England the popularity that tea has already achieved. We are only sorry that the venture is a *Brazilian* one, and not an Indian; but there is doubtless room for more concerns of a similar kind.

THE MANSION HOUSE WAR FUND.

We trust that South Indian planters "will not be backward in coming forward" with regard to the War Fund that has been opened. One fund was started for Transvaal refugees; but the fund to which we call special attention is that for the relief or support of widows and orphans of soldiers who fall in the course of the war, and of the wounded. Ceylon men have made a start, and it has been suggested that planters should voluntarily tax themselves *Re.1 per acre* in behalf of the fund. We are aware that a good many of the younger generation of planters were ready to render service as "fighting men." Such patriotic souls should not hesitate to deprive themselves of some few rupees for such a cause as that now referred to.

We shall be very pleased to receive and acknowledge subscriptions, and to pass them on, in due course, to the Lord Mayor of London.

THE SEPTEMBER COFFEE MOVEMENT IN THE UNITED STATES.

The *American Grocer* again records a month of heavy deliveries—above the monthly average for the exceptional year 1898-99. The total deliveries of all kinds of coffee in the United States during September were 479,874 bags, against 436,890 bags for same month in 1898, and 473,553 bags as the average per month last year. The visible supply and movement for the month are shown as follows :—

	Bags.	Thousands of Bags.
Stocks, September 1, 1899—		
United States..	1,176,447	
Europe..	3,780,097—	4,950
Receipts during September—		
United States..	494,077	
Europe..	648,313—	1,142
Total supply ..		6,098
Less stocks, October 1—		
United States..	1,190,650	
Europe..	3,705,906—	4,896
Deliveries, September—		
United States..	479,874	
Europe..	722,504—	1,202
Deliveries, September, 1898 ..		1,131

The total visible supply of the world on October 1st was 8,036,566 bags—or a full half-year's production—and receipts at Santos continue large. The capabilities of Brazil as a coffee-producer are enormous, the crop is scarcely likely to shrink for some time to come. Under these circumstances, there is just a crumb of comfort in our American contemporary's statement that "the outlook is for a heavy full demand and record-breaking deliveries." On the other hand, however, as supplies are likely to continue heavy, the chances for cheap coffee are good for another year. If demand could but be stimulated in Europe, as it has been in America, the desired improvement in prices might be hastened; but we fear that hitherto practically all the profit resulting from the fall in prices has gone to the dealer and the retailer—in England, at any rate—and that the consumer is still called upon to pay former prices for a commodity of which the value has fallen considerably.

PACKET TEA AT THE PARIS EXHIBITION.

The following circular, by Mr. J. H. Renton, Tea Representative of Ceylon at the Paris Exhibition, shows how the packet tea difficulty is to be met :—

In addition to the teas which will be received for competition, the Committee are prepared to undertake the exhibit and sale of packet teas under the following conditions :

1. Show cases or stands will be provided; a charge of 100 francs per square metre will be made to cover cost of same.
2. Each exhibitor should furnish a large card giving name in full, Ceylon address, and name of agents in London and Continent.
3. The French authorities have prohibited the sale of packet teas in the Exhibition; but the Committee are prepared to book orders in the Ceylon Court, which will be passed on to the Paris or London Agents of the exhibitors for execution and delivery. A commission of 10 per cent. will be charged on all orders booked and sales made in the Ceylon Court. Exhibitors desirous of availing themselves of this opportunity for sale of their teas must make their own arrangements in Paris for keeping stocks and for supply of packet teas in the Exhibition.
4. The Committee reserve to themselves the right to decline to exhibit any packet teas.
5. Intending exhibitors must send in their applications for space with particulars of their teas, names of their Paris Agents, and prices at which the teas can be sold, by not later than 1st February, 1900.

N.B.—All packet teas for sale in France must be put up in French weights, *viz.*, kilos. and fractions of kilos.

Further information can be obtained on application to—J. H. Renton (Tea Representative, Paris Exhibition).

There is apparently no reason why the U. P. A. S. I. should not take a leaf out of this circular, and arrange similarly about both exhibits and sales.

COFFEE IN DISTANT LANDS.

XI.

Hayti.—Reporting on the Trade and Commerce of the Republic of Hayti for the year 1898, Acting Consul-General Siordet, says :—The year 1898 has not shown any improvement on preceding years as regards commerce and business in Hayti. On the contrary, the present situation is worse than it has ever been before. The reason of this state of things is to be attributed to the persistent fall of prices of coffee on the European and American markets. The actual prices have declined to a point which renders the exportation of the article almost an impossibility, and being the staple produce of the country, a marked depreciation of its value must greatly influence the commercial prosperity of the Republic. The only remedy, *viz.*, an increase of production, is not thought of here. On the contrary, it is to be feared that many small "planters" (as the owners of coffee trees are called) will dig up the coffee plants and raise plantains, yams, bananas, &c., on their soil. The existing export duties on coffee amount to 3 dol. 87 c. (about 16s.) per 100 lbs., and may be considered almost prohibitive. Unfortunately it is not possible for the Govern-

ment to reduce them at the present moment, as they are the security of the various internal debts.

During the past year ordinary Haytian coffee has fetched in the European markets an average price of about 7 dol. 50 c. per 100 lbs. From this 5 dol. have to be deducted, *viz.*, 3 dol. 87 c. for export duties, and about 1 dol. 13 c. for cartage, bags, freight, and other expenses, leaving for the planter just 2 dol. 50 c. per 100 lbs. for his produce, or 2½ c. (1¼d.) per lb. The planter, therefore, only realises enough to provide for his absolute necessities in foreign imports, and turns his attention to the cultivation of other products, on which he has to live ; consequently, imports have diminished to a very large extent, and whilst the planters, cultivators, and the country people have managed to exist, many importing firms have had to suspend payment for want of business.

Dutch Guiana.—Exports in 1898 amounted to 255,571 kilos. valued at £8,576. The crop was on the whole good, but prices were low, owing to large stocks on hand and abundant crops in Brazil. The coffee cultivated in Dutch Guiana, is, with a few exceptions, Liberian, so low prices are to be expected. The crop totalled 383,512 kilos.

French Guiana.—Exports in 1898 amounted to 429,200 kilos. A few immigrants were employed as estate labourers, or ages berry 3 frames a day, with accommodation.

Jamaica.—Consul Dent sends a report on coffee, prepared by a well-known planter in the island, as follows :

I have been coffee planting for the last twenty years, and during that time I have twice seen a fluctuation of prices of 60 per cent. ; and the average prices I have realized have varied from 89*s.* 6*d.* to 42*s.* per hundredweight ($21.78 to $10.22 per 112 pounds). This large difference in values, combined with a very great uncertainty as to crops—these being dependent upon the proper distribution of the rainfall and not upon the cultivation—makes coffee planting difficult. When I say the crop is not dependent on the cultivation, I mean that, however good the cultivation may be, without proper weather there will be no crop. With practically the same acreage as now—*i. e.*, 330 acres—my crops have ranged from 22 casks of 850 pounds to (in one year) 154 casks. The best seasons may be said to be : A dry January and February to rest the trees after the previous crops ; showers to bring out blossoms—the best is a general bloom in April, then good rains in May and a not too hot July and August. If the latter months are hot, the crop is likely to be burnt before it is mature. The low prices are attributable to the immense production of coffee in Brazil.

" When once coffee growing is well establisbed, four hundredweights (448 pounds) per acre may be expected, and this return should last for fifteen years at least. It may vary considerably from year to year ; thus, after a very heavy crop, say, six hundredweights (672 pounds), or even seven hundredweights (784 pounds) per acre, the return would be proportionately small ; still, four hundredweights per acre would be about the return in good land, and without fertilizers would last fifteen years. In this part of the island we expect coffee to bear for twenty years after the first bearing, say, twenty-five years from the time of planting.

" Speaking roughly, the cost of land, fencing, cultivation, and all other charges should come to £15($73) per acre by the end of the fifth year—that is, the year when one may reasonably expect a crop ; a small crop would be reaped possibly the third or fourth year, but it is not good for the trees. I think that a fair estimate of the cultivation, reaping, and curing of the crop per acre, including 10 per cent. f supervision and 10 per cent. for extras, is £5 ($24.33) for return of four hundredweights of clean coffee fit for sale.

" The price of land varies very much, but, generally speak ing, £1 ($4.8665) an acre has been considered fair valu Of course, there are lands to be had at much lower prices the Government lands sell at about 5*s.* ($1.22) per acre. I short, there is no regular price, values being determined b the situation. It would be useless to undertake coffee plant ing unless there is plenty of labour, as much is needed f weeding, pruning, and reaping.

" As to the price of land in coffee, I should imagine tha about £20 ($97.33) an acre for old and £30 ($146) for youn coffee would satisfy most people.

" Rye crops could not be planted between the rows of coffe trees, though orange trees might be planted at this altitud (2,200 feet) in place of other shade trees. During the firs three years some sort of shade is necessary, and it is th custom to plant yams, cassava, cocoa, etc., but this shoul be done sparingly, as undergrowth is not good for the tree

" The climate here has averaged 72 degrees Fahrenheit i the shade for years. In the summer it rarely goes above 8 degrees Fahrenheit. We have two rainy seasons—one in Ma and one in October.

" It is always healthy in the coffee-growing districts, as th best altitude for that industry is between 2,000 and 4,000 feet In this parish (Manchester) we are dependent for our water supply on rain caught in tanks."

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

XX.

Withering—is one of the most important of the processes of manufacture. A number of machines for the purpose have been invented ; but none, so far as we are aware of, is of any use whatever. Hot air admitted into a large and lofty room too, does a considerable amount of damage, however carefully regulated. The finest tea is made when a good wither i obtained at 70°F., and so experiments to improve the wither ing had best be tried while that temperature is maintained It will then necessarily be a very long process like the drying of tiles. If the leaf can be kept for three days withou becoming putrid, in a temperature of 70°, a very fine flavoury tea will be the result. Here is the difficulty. I appears to us as if the air must be charged with the right microbe, as in butter-making, to secure definite results, and perhaps, we shall yet see this advertized for sale in bottles as for butter ! Steam from drying tea does a good deal o damage, the leaf undergoing a stewing process not unlike that to which Japanese subject their leaf in the preparation of *green-tea*. Unfortunately, many factories are constructed so as to utilize the exhaust steam from tea driers. It is better to have this steam go clean away into the open air passing in a closed pipe through the withering room, thus using only the heat from radiation. Far better results will then be secured. If leaf on the withering tats comes in contact with steam, the effect is similar to that of the sun upon it, after it is plucked. Its power to absorb oxygen appears to be destroyed. For this reason, great care is needed in the field, the leaf being placed into covered baskets and under the shade of any tree, if it is not carried away at once to the factory. We have always worked our

withering shed to secure a temperature ranging between 70° and 85°. To secure this, not only is the exhaust pipe carried through the withering room, but a flue is also built in, and kept hot night and day. A fairly good wither is thus obtained throughout the year, each day's leaf being always ready for the rollers at 7 A.M. With the kind of rack we have arranged for (a full plan of which will appear later on), the leaf, after being weighed, is carried to the end, where the charging and discharging arrangement is, and thrown down in a heap. A boy of ten to twelve years of age sprinkles it on to the sheet, while another lad, at the other end, draws a cord over a pulley, the sheet gliding in after the cord. The work of laying the leaf to wither is thus most rapidly got through, two boys can finish 1,000 pounds in two hours, and are enough to do all the work connected with 2,000 lbs. of leaf from the time they get it from the women to the time it is delivered to the rollers. The charging and discharging takes them six hours and the cleaning up, &c., two hours. They have at times to work overtime, for which they are separately paid at the rate of three pies per boy per hour. The leaf is laid very thin in wet weather, and thicker in dry. The discharging is easily accomplished by simply drawing the sheet forward, with a shaking motion, odd leaves that adhere to sheets being removed as the sheet is drawn back. Thus the discharging is done in one-half of the time that it takes to charge. All other systems we have so far seen are expensive and unsatisfactory. Rollers to roll the sheets on do not at all answer from their liability to become deranged, and from the fact that leaf does not fall off the sheets quite so easily as is supposed. Fixed tats we do not consider advisable from the difficulty there is in getting the leaf off, and the expense of repairing. Space, too, would not be so economized as with the system we advise.

Sunlight—coming in at any of the windows must be kept off the leaf by cheap blinds that can be let down, or raised at will. If these are not provided, the leaf, in those parts where the light falls, will be found blackened. Staircases should have a trap-door, and must be kept shut, to prevent a rush of heated air up them as, if this takes place, the parts affected will be found to *over-wither and blacken.*

NOTES.

Notes from Brazil. The *Brazilian Review* of 3rd ultimo says :—Rain has fallen at S. José do Rio Pardo and pretty generally over the States of Rio and S. Paulo in some districts of which the drought threatened serious damage to the crops.

Liptonia. Sir Thomas Lipton's "racing colors" have been frequently worn of late. If they are not, they ought to be, green (for Ireland, tea and public), black (tea), silver (tin) and crushed raspberry (*vide* British Court records) arranged in streaks *à la Bacon*, not stripes.

Calcutta Tea Sales. At the Tea Sales on 10th instant, 21,916 packages were sold. A firm tone prevailed throughout the sale Common leaf teas were rather higher. All districts were well represented, except Darjeeling broken pekoes ; and broken orange pekoes are at present out of favour, and sold a trifle lower.

Transition. Thus the *American Grocer* :—"The commercial world seems to be in a transition period. Old business customs and methods are being supplanted by those which are the outgrowth of our modern aggressive and progressive conditions." Have tea and coffee-planters in India fully realised this ? We doubt it.

Ceylon Green Teas. The "Salada" Tea Company state that they have decided to "go into" Ceylon green teas, and believe there is a great future before them. They say :—"We believe, in fact, that instead of climbing a steep hill, as we have done in displacing Japan Teas with Ceylon Blacks, we have a comparatively easy path in Ceylon Greens, and propose to push them for all we are worth."

The London Tea Market. Messrs. Gow, Wilson & Stanton cabled to Colombo, on the 9th instant, that demand was running on low-priced teas. Fair liquoring Ceylon Pekoe Souchong 7d. (¼d. up), average of Ceylon teas for the week 8¼d. (⅛d. down). Reuter reported sales of 26,000 packages Ceylons out of 29,000 offered, and 43,000 Indians out of 48,000 offered. Average of India 8¾d. (¼d. down).

Ceylon's ex-Cryptogamist. A London correspondent writes to a Colombo paper :—"Mr. Carruthers tells me that Mr. Willis has asked him to join the Peradeniya staff as Assistant. He would much prefer to be independent, or at least only under the Agricultural Board ; and I think myself he would be of much more service to planters in that capacity than if a subordinate at Peradeniya, where much of his time might be taken up with routine duties."

An unexplained Discrepancy. We called attention recently to a discrepancy between the estimate (Coffee crop) of the Sao Carlos Club (1,200,000 arrobas) and that of the local Municipality (700,000 arrobas). It is now stated that the Club's estimate was obtained by summing together all the different estimates furnished by the planters themselves. If these gentlemen have overshot the mark, they have been very indiscreet.

Rubber Export from Brazil. During the first six months of 1899, says the *South American Journal*, the total amount of rubber exported from Brazil was 9,441,988 kilogrammes, of which 3,103,452 kilogrammes were sent to Europe, and 6,338,536 kilogrammes to the United States. According to quality there were 5,271,167 kilogrammes of fine rubber ; 733,288 kilogrammes of demi-fine ; 2,599,759 kilogrammes of sernamby, and 897,774 of caucho.

Tea Houses at Balmoral. According to the *Morning Leader*, the Queen intends to add one more to the list of tea-houses on the Balmoral Estate. Each of these retreats is decorated to represent some particular country. For instance, there is "India," which is furnished with bamboo and Indian matting, while "China" is decorated with the celestial emblems in beautiful colourings. The new tea-house is to be "America," and will be put up in readiness for next year. No doubt our American cousins will regard it as a royal recognition of America's claim to be enrolled in the list of tea-producing countries !

A 300 per cent. Duty on Coffee. The following telegram was lately published in New York papers :—

NEW YORK, 12th September.

"A telegram from Rio de Janeiro states that the Permanent Committee on Tariffs of the Chamber of Deputies has reported in favour of an export duty on coffee for France, Germany and Italy three times greater than the value of the article. The Custom House proposes a moveable tariff in favour of nations making concessions to Brazil.

Bolivia has accepted the rectification of the frontier with Brazil, adopting the line of Cunha to Gomez, which will avert complications."—(*Reuter*).

Reuter's service in India is at least a shade more reliable than the above !

Colombo Tea Sales. At the public sales of tea at Colombo on the 8th instant about 7,244 packages = 631,364 lbs. were offered, of which about 6,118 packages = 544,549 lbs. were sold. There was a strong demand for all leaf teas at the auction, and prices were again very firm with a hardening tendency, and other grades remained steady at about previous rates. The *Times of Ceylon* states that good invoices were offered from Agra Ouvah, Glasgow, Annandale, Nillomally, Tonacombe, High Forest, Scrubs, Penrhos, and Dunbar. By the way, the last tea sales in December will be held on Tuesday, the 19th, and the first sale in January on Wednesday, the 10th.

Sales of Brazilian Plantations. The *Jornal do Commercio* lately announced the offer of a plantation in the municipality of Sao José da Boa Vista valued at 150:000$ for the insignificant sum of 16:000$, or little more than one-tenth of its cost price. Cheap as plantations are going at present, observes the *Brazilian Review* on this, any one who expects to yet purchase at rates like these would be sadly disappointed as, in addition to the payment of the 16:000$ cash, he would probably find himself saddled with mortgages up to at least half the valuation, that is, that, in place of 16:000$, he would really have to pay 91:000$ to get a clear and unembarrassed title.

Nyasaland Coffee. The Second Annual Show of the Nyasaland Agri-Horticultural Society was held at Blantyre on Friday, the 15th September. The *Central African Times* remarks :—"Among the more noticeable features, going round the Show casually, were the large number of Coffee Exhibits in which the staple cultivation of the country was well represented. It is also worth noticing that Namasi District took the first prize for hulled Coffee and second prize for the Parchment. The coffee was from Keiller's African Trading Company's place at Namasi and had been cured and prepared by Mr. W. J. Livingstone, to whom great credit is due. Incidentally we may remark that it shows that Namasi district is not to be so lightly despised as some people imagine, and there can be doubt that, with ordinary conditions, Namasi will turn out equal to most of the planting districts of the Shiré Highlands."

Bogus Cinnamon. It was stated some time ago that quantities of a bark somewhat similar to cinnamon were being shipped from Ceylon as the real article. That there was good ground for the complaint is proved by the issue of the following circular by the Collector of Customs :—

CIRCULAR.

It having been brought to notice that wild cinnamon has been entered for export as cinnamon, it is hereby notified that from this date the description "Cinnamon" will not admitted at the Customs, and exporters must declare the b as being either "Plantation Cinnamon" or "Wild Cin mon."

The attention of Ships' Agents is requested to the rule t the description of goods in the "Outward Contents" m correspond with the description in the boat notes.

H. L. MOYSEY,
Principal Collector

H. M. Customs, Colombo, Nov. 9th, 1899.

To make good Coffee. It is about time Indian tea-plant inaugurated classes for the instr tion of the Englishwoman at Home in the art of mak good coffee. Here is a recipe that might form a basis criticism until something better is evolved. Pure coffe necessary—no chicory—either for café noir or café-au-lait. fair allowance is 2 oz. of roasted and ground coffee to a p of water for café noir ; for café-au-lait three parts of hot m may be allowed to one part of coffee. Warm the beans o plate before grinding. When ground put in a warm j and slowly fill with boiling water. Then stir well with enamel spoon for about a minute. Now let it stand, cove with a saucer, for an hour. Dip the strainer in hot wat wring out ; and slowly pour the contents of the jug throu the strainer into an enamel coffee-pot. Let it come just t boil, and it is ready for immediate use, or will keep perfe for several days. Always wash the strainer in very hot wa immediately after use, an leave it to dry hanging on a ho in the larder—never leave in the coffee-pot. Great attent should be paid to this, as a neglected strainer is enough spoil the finest coffee. A nainsook muslin strainer is bes metal should be avoided. Perhaps this may be the cause so many failures in coffee, using a metal strainer or an i perfectly cleaned muslin one.

Malaria Infection. The German Expedition, cons ing of Professor Frasch, Dr. Ko and Staff-Surgeon Ollwig, have issued a report embodying results of their investigations on the means by which mala is propagated and the most effectual methods of combati the disease. For the purpose of their investigation, the co mission, on the advice of Professor Gosio, fixed their hea quarters at Grosseto, in the Tuscan Maremma, and exten their stay from April 25th to August 1st this year. T district is a marshy one, and has long held a bad reputat on account of the prevalence of malaria. The conclusi arrived at by the commission are, says the *British and Colon Druggist*, that the two hosts of the malarial microbe human beings and certain species of gnats (the *Culex pipi* and the *Anepheles maculipennis*). The gnats, however, only active during July, August, and September, and th obtain the infective germs from persons in whose system bacilli have not been annihilated. The commission conclu that, if every person contracting the disease is properly trea by sufficiently prolonged administration of quinine, the dise could be thoroughly stamped out, as no infected persons wo remain to carry the infection over from one summer until gnats make their appearance in the next.

Tea Caravans. Russian tea-traders have recei news, says the *Leisure Hour* October, that the great caravans will shortly start on th

long journey across Siberia. Within recent years much of the tea consumed in Russia has made the sea voyage from Chinese ports to Odessa on the Black Sea, but Russians say that tea transported by sea loses much in flavour and quality. In consequence of this the largest tea merchants still continue to receive the bulk of their stock by the overland route. Early in January the caravans arrived in Tomask. Between the 1st and the 20th of the month, 19,000 sledges full of tea are expected, each sledge containing five packages of about 130 lbs. each. The tea is packed not in cases, but in stiffened ox-hides. Five sledges are tied together and drawn by one horse. The last sledge of each group contains hay and barley, which the horse of the next group quietly munches as he travels. In consequence of this arrangement, the caravans lose no time. The first horse only, who does not feed as he walks, is changed from time to time. The horses are changed in the villages along the road, but as villages are rarely met it often happens that the horses collapse from over-fatigue. The leaders of the caravan, usually Kirghiz, sleep in the sledges, although the thermometer is often 40 degrees below freezing-point. From the Chinese tea-growing districts Tomask is a year's journey by caravan.

Ceylon Tea at Zanzibar.

The following is from the *Zanzibar Gazette* :—We have decided to give this product a trial, because of the healthy appearance of the tea bushes at Miss Thakeray's shamba, Mbweni, planted by Sir John Kirk. These were pruned down in October and flushed well, bearing enough new growth in two months to form a plucking surface and leave 6 inches of pruning wood. Half a maund of Horagalla, Ceylon, Assam Hybrid, has been obtained and planted in the new nursery at Mpapa and is growing well. This should give us enough plants for six acres, planting five by five, and leave a margin for supplies and distribution. I don't think that Zanzibar will ever enter the lists as a tea-producing country, even if low-country varieties are found to flourish here, as the labour-supply is too small and uncertain. The plentiful supply of organised labour in Ceylon is one of the chief reasons why that country has taken the lead in this industry, while Natal is an example where the comparatively adverse conditions of labour have operated unfavourably. In our present unstable condition of labour, we could not do more than grow a few acres for local consumption and perhaps induce Arabs and natives to cultivate a few trees for their own use. Another point to remember is that tea is a declining market and is probably already over-produced.

Rubber Cultivation.

According to the views of Senor Horta, who has recently issued a pamphlet on "Rubber in Guatemala," the climate most appropriate for the growth of the rubber tree is that of the Tierra Caliente, or hot coast lands, at an altitude not exceeding 1,500 feet, and the trees should not be planted in the sun, although the contrary opinion is held, and has been expressed by some authorities. Senor Horta gives as his reasons for this opinion : (1) The nature of the rubber tree ; (2) experiments made in Guatemala ; (3) the fact that by planting in the shade there is complete security and a satisfactory result. Experiments in Guatemala have shown that rubber plantations in the open do not develop nor give a profitable yield, and planters have suffered serious loss on this account, not only in this country, but also in Tobasco, Chiapas (in Mexico), and in British Honduras. By planting in the shade it will always be an easy matter, if special conditions of the soil so require, to remove superfluous shelter. The yield of rubber trees has been estimated by some agriculturists as high as 3 lbs. yearly from the sixth year. Senor Horta does not consider that trees should be tapped before their ninth year, and says that, according to his personal experience, 1 lb. of rubber, say, 2½ lbs. to 3 lbs. of milk, is a good annual yield.

South Indian Teas at Colombo.

The *Times of Ceylon* says :—We have made further inquiries to-day regarding the possibility of the teas from Travancore and elsewhere in Southern India going into the Customs returns at Colombo as Ceylon produce. The teas are put up for sale in our local auctions, and in that way appear in the brokers' lists and in the Chamber of Commerce figures ; but we are assured that they do not go into the Customs returns, the transhipment warehouse figures being kept separate. *Apropos* of this subject, there was an impression abroad to-day that the employees of a local firm had been found, in the transhipment warehouse, obliterating "Travancore" on a number of chests put up for sale last Wednesday, and inserting in their place the word "Ceylon." This would have been an offence under the Merchandise Marks Act, which is embodied in a local Ordinance ; and we made enquiries at the Customs. We learn that the foundation for the rumour was that in South India the net and gross weights on the boxes had been obliterated—for what reason is not known—and that no alteration of the name of the country of production had been attempted. There are rules against the alteration of any marks, and had the Customs authorities at the port of exit in South India done their duty, it is said, the matter would have been righted there ; but this not having taken place it was remedied in Colombo. So far as the Customs authorities here are aware, this is the only case of the kind that has occurred.

GENERAL ARTICLES.

AN INDIAN AUTHORITY ON JAVA CINCHONA.

Reviewing the report of Mr. Standen on his visit to Java, the *British and Colonial Druggist* makes the following remarks *inter alia* :—

What our readers look for in a report of this kind is commercial information or scientific matter closely connected with the botany or chemistry of cinchona.

Dealing with the commercial information first, we might search the report for answers on four or five questions which would really put all the points that business men interested in bark and quinine think to be worth considering as regards Java. We might ask—

(1) Has Java any considerable stock of bark ; if so, how much ?
(2) Does the export of 1898 represent a natural year's yield of bark ; if it does not, what is an average natural crop ?
(3) Is Java extending its cinchona cultivation ; if it is, when will the result begin to be seen in the export figures ; may we expect it shortly and gradually increasing, or will the yield from recently-planted trees come upon us thick in a few years ?
(4) At what unit does it pay to cultivate bark in Java ?
(5) Are the quinine factories in Java a success and likely to grow ?

It would be a remarkable fact if Mr. Standen had supplied direct answers to these questions. Of course he has not, but to one or two his statements furnish immediate replies, whilst to others pretty conclusive answers may be constructed from the material of the report taken together with present knowledge. For instance, nothing is said as to the existence or absence of stocks of bark in Java,

but we may draw a fairly safe inference on comparing certain remarks in the report with well-known facts. In the first place, Mr. Standen tells us that he could not discover precisely what the area under cinchona cultivation is in Java, but "it is generally supposed to be about 20,000 acres." Now, the Government crop of bark, according to recent figures, averages about 300 lbs. per acre. As the Government plantations are worked in such a way that Mr. Standen regards them as a fair basis for commercial calculations, at any rate so far as the cost of bark-production goes, we may say that a crop for the whole of the cinchona district would be about 6,000,000 lbs.

Considering along with this the fact that from beginning of 1893 to the end of 1898 there were over 55,000,000 lbs. of bark exported from Java, we come to the conclusion that the annual average export of the island for these six years is over the present annual crop. Five years ago the report tells us there was a larger acreage under cultivation, and this we can well understand. . . The conclusion we come to is that an export of 1,000,000 lbs. a month is beyond the natural yield of the present crop in Java, and in this belief we are supported by a statement in Mr. Standen's report, which is independent of the present reasoning. Speaking directly of the exports, he says :—

> I am of opinion, however, that these large shipments cannot be kept up without discounting the yield of the plantations in the future, unless new land is opened to counter-balance the lower yield from ground which has been re-planted.

We have now as good an answer as can be given in the present state of our knowledge on this side, to questions (1) and (2) above. In reply to question (3), we also have Mr. Standen's distinct statement that the recent advance in bark has revived interest in cinchona planting and several new clearings have been made. But we do not know of what extent these are, though the date of this report and the period of the great rise in the unit, would fix the early part of this year as the time when planters were encouraged to extend cinchona cultivation again. If that is true, and there are other reports to justify it, the result would not begin to be seen until four years from the commencement of 1899. There is, therefore, good reason to believe that the "natural" result of this year's advance in price would not be seen in the exports of bark from Java until 1903. Even then the new plantations will, of course, not yield to their full extent for another four years. Some interesting data appear on this point.

In what has been already said there is an answer to question (4). On the fifth and last question, nothing precise can be learnt from the report, the only pertinent statement being that "the Bandoeng quinine factory has not met with the support which it deserves." In confirmation of this appears the idea of transferring the Java bark market from Amsterdam to Batavia. This may get rid of the importers as an element in the situation, but it does not go deep into the cause of the planter's weakness, which is and has been for years distrust of each other, and inability to work for anything but immediate needs.

THE CAMERON DISCOVERY.

NOTES ON THE "SPOTTED COFFEE-BUG" AND KINDRED QUESTIONS.

The following report was proposed by Mr. Mahon of the Scientific Department of the B. C. A. Administration :—

When the particulars of Mr. Cameron's discovery were forwarded to me for examination and report, it was suggested that I should write something on the subject as soon as the facts were made public property. There are a few points, perhaps, that may be briefly touched upon to some purpose.

With the descriptions and mode of life of the insect, as set forth in the pamphlet just published, I find no grounds for differing, and it does not seem necessary to repeat them here. When my attention was directed to the matter, our dry season was too far advanced for any very critical observations, as undoubtedly the insects' chief depredations are committed while the coffee berries are young and growing. Careful search in a couple of plantations, where "spotted" and "light" bean are common, failed to reveal the insect, and but little success attended a considerable hunt amongst the flowers and fruits of many native plants. This was during the latter half of July. In Mr. Cameron's company I subsequently saw the creature at work in his gardens wherever green berries were common. That the numbers seen were not great was due, doubtless, to the vigorous measures he was taking for their destruction. I observed the insect a day or so later in greater force on the neighbou Magomero estate, but I did not find it on other Nyasa plantat

At Zomba, early in August, I met with another phase of the c tures' mischievous habits which, although it did not surpri when I found it, is not mentioned by Mr Cameron. Examining beds of seedling *Coffea Arabica* (unshaded) which we raised rece I noticed the terminals and young "primaries" of many droop whilst some were killed. Presently I came on a few of the sucking these parts in other seedlings, proving them to be cause. At the same time I found a relative of theirs, as large longicorn beetle and of a dull brownish colour, who was occu in the same destructive work. He prefers to conduct operat head downwards always and resembles a fragment of dead bra or leaf at the first glance. This indicates that the planter's lance must not only be exercised over plants in bearing, but a ally from the time his Coffee germinates. My observations lead to the same conclusions as Mr. Cameron regarding the "spo bug" and its congeners being the principal cause of "spotted b and to a certain extent, of "empty" or "light" berry also. Conc ing the latter, however, I find so much of it with practically traces of external attack, that I am compelled to repeat the opi hitherto expressed, namely, that "empty berry" is due to def and want of stamina generally in the plant. But that "spo bean" is largely due to the cause mentioned above I have no do As a matter of fact, the Haustellate group of Hemipterous ins are very numerous in this country, as they are in countries pos sing similar climatic conditions, and it is necessary to wage in sant war on all of them. The sub-order *Hemiptera* of the c INSECTA contains, perhaps, the greatest pests that man and o animals, as well as the vegetable world, suffer from, and haustellate (*i.e.* provided with a *haustellum* or sucker) group the worst of an extremely bad lot. The illustration of the rav members of this group can effect in the case of a considerable digenous forest tree (*Bersama*, native name "Sekese") is inst tive. Anyone who has collected seeds of our native plants m have been struck with the very small percentage of good mat obtainable.

This is true in almost every instance. Naturally, in the cas coffee, we spread a plentiful table for the "spotted-bug" and relatives, just as we harbour and foster boring beetles (and growth of fungi) by neglecting to burn or remove every particl dead wood in a garden. For it is a rule that insects prefer to in close proximity to the feeding material they find most suita It is also true that soil constitutionally poor, or impoverished faulty cultivation, and where growth is stunted, are natural br ing grounds for insects. The fact so frequently observed young, or virgin. coffee crops are practically immune from "spo bean" coincides exactly with what entomologists point out, nam that injurious insects select sickly, stunted, or weakly plants their attack; while the preference "bug" shows for green ber is characteristic of the group which lives on green food and wh ravenous propensities are notorious: we see this in the well-kn genus *Thrips*. Planters will recollect how these latter quite foliated coffee gardens in several districts during the last month 1897. Professor Alphens Packard points out that injurious ins become suddenly abundant in newly cultivated tracts where former presence of forests, and their natural enemies, kept th under. The balance of nature appears to be disturbed, and inse multiplying rapidly, become terrible pests. In the course of t however, they seem to decrease in numbers and the former bala is restored. He also remarks that insects often have a metrop where they occur in great abundance, and, judging from the n bers of "spotted-bug" collected by Mr. Cameron this year, his pl ation would seem to be in or near a metropolitan area. Concer remedies for the destruction of this pest, I do not consider means more satisfactory than their collection by children as, fo nately, the creature is extremely easy to catch, and so are o members of the group that came under observation. It would interesting to experiment with the locust serum as it might pr effective. I feel certain, however, hand-picking, with the aid their natural enemies, will suppress them, for we have many their inveterate enemies (the lady-birds) here. I have seen examined the latter myself, while various genera and species named in the list given in Johnston's "British Central Africa."

That Mr. Cameron should have noticed the "spotted-bug" s back as ten years ago at Mandala and suspect its evil-doing is a matter of interest, and while it is to be regretted that the f

were not brought to light earlier, yet this is an instance where the adage "better late than never" is happily *apropos*. Personally, my attention never was drawn to the matter during my visits to coffee estates, and although I learned recently the late Mr. Buchanan wrote about the creature in the "C. A. Planter" of his day, yet that was sometime prior to my arrival in the Protectorate and the question, if ever it excited any local interest, had evidently ceased to be remembered. To Mr. Cameron, therefore, all the more credit is due for so effectively resuscitating it.

INDIAN AND CEYLON TEA.

Mr. Arthur E. Nicholson (an authority on Indian and Ceylon Teas) writes to the *American Grocer* :—

Leaf manipulation and manufacture in Ceylon and India is very dissimilar to the process in vogue in China and Japan. Many of the processes employed by the Chinese are quite superfluous, and several of the manual operations which bulk largely in their manufacture have with advantage been supplanted by mechanical agency. Of these may be instanced rolling. How much is gained in point of cleanliness by the employment of machinery in rolling becomes evident if the effect of the operation upon the leaf is considered. Before it will receive a good twist, the leaf must first be reduced to a soft, mashy state, and to do this the essential oil has to be expressed from the cells with which it is dotted. In Ceylon all this is done by machinery. In China the operation is performed by hand, and it only requires that process to be pictured to see that in it the leaf must derive a considerable amount of dirt and perspiration from the hands of the unwashed Mongolian.

Although it were absurd to imagine that all has been learned that may be learned in tea manufacture, the actual processes are essentially simple, and may be readily understood.

The whole object of the manufacturer is to roll, ferment, and dry the leaf ; and to this end it undergoes withering, rolling, fermenting, and firing. As soon as the leaf arrives at the factory it is taken to the lofts above and spread thinly on tats, or shelves, to wither. Withering is a preliminary to rolling. The object of it is that the leaf may become soft, limp, and flaccid, so that it may be susceptible of receiving a good twist when put into the rolling machine. Tats are usually made either of canvas or wire, through which the air can pass freely. To wither well, leaf requires light, warmth, and a dry atmosphere. In fair weather it will wither naturally in about twenty hours ; but on wet or dull days it becomes necessary to employ mechanical agency, and to act upon the leaf with artificially dried and heated air. If compressed in the hand, withered leaf folds together into a clammy mass without crackling or rebound. It may be mentioned that green leaf loses about one-third of its weight in withering, and rather more than another third in the several other processes through which it passes.

The process of manufacture commences with plucking. The bushes having been pruned and cultivated, throw out vigorous, fresh growths, and these in turn put forth shoots and leaves, called a "flush" by planters.

The plucking is done by gangs of women, who pass down between the lines of bushes, plucking the young leaves and dropping them into the baskets they carry. Their energies are stimulated by their daily pay being regulated by the weight of leaf they bring in, and they are checked from plucking old leaf by minus marks being placed against their names for any large leaf found in their baskets.

The leaf, after gathering, is placed in a withering room, where it is spread in thin layers on lattice-work shelves, and there left until the moisture is evaporated and the leaves left soft and flexible.

After withering, the leaf is run down shoots on to the rolling tables, of which there are various sorts, but the principle is the same in each, viz., two plane surfaces revolving one over the other somewhat after the fashion of millstones, but with a freer swinging action, so as to roll and not grind the leaf. The faces of both the upper and lower tables are of wood, and the leaf is rolled under sufficient pressure to give it the desired twist without breaking it.

FERMENTATON.

The process of rolling having broken open the leaf cells facilitates the chemical change which follow, and which are grouped together and termed "fermentation" by planters for want of a better name. These changes are very obscure, and have not been determined by competent chemists. So far as appearances go, the most important one is oxidization. The leaf on being taken from the rollers is still more green than any other colour. In this stage it is spread out with the rolling machine, and soon assumes a copperish brown colour, due to oxidization. It is then put through the next stage.

FIRING.

The "fermented" leaf is spread upon trays and passed into closed machine, of which there are several patterns. But, as in the rollers, the principle is the same in each, viz., to fire the tea by exposure to a suitably regulated current of hot air drawn through the machine by means of fans. This process corresponds with "pan" and basket firing ; but the firing in modern factories does not allow the leaf to be subjected to the direct heat of the fire, and the temperature can be regulated to a nicety to attain the end without destroying the essential qualities of the leaf.

SORTING.

The final stage has now been reached, the whole process after the leaf is withered occupying less than two hours with modern machinery. Up to this stage, all the leaf, as brought in by the pluckers, has been treated together, but as each of the leaves and the bud represent different qualities and different values, they have now to be separated. This is done by means of graduated sieves made to oscillate by means of a pulley. The "tip," in varying proportions, with some of the leaf nearest to it, makes Orange. or Flowery Pekoe, of proportionately varying values. The small leaf makes Pekoe, with which a small quantity of "tip" remains ; the large leaf makes Souchong, and the mixture makes Pekoe souchong. Broken Orange Pekoe, etc., are simply the broken leaves of their respective qualities, and are preferred by some consumers. In the sorting process some dust and fannings are also separated.

In former years, when Congou tea was made in India, these leaves and the bud used to be plucked, but the Congou leaf is now left on the bush and helps the growth of the more valuable young flush, which spring from its axil.

When sufficient tea has been collected to form a "break," it is re-fired at a low temperature, to get rid of any moisture, absorbed from the atmosphere, and packed at once in lead-lined boxes, when it is ready for the market.

TEA, ETC., COMPANIES.

The Wynaad Tea Company, Ld.—The following is from the report to be presented at the fifth Annual Meeting of shareholders, to be held at No. 20, Eastcheap, at the office of the Ceylon Tea Plantations Company, Limited, on Monday next :—

The directors, in presenting to the shareholders the profit and loss account and balance-sheet for the year ending March 31, 1899, wish to explain that the reason the accounts are for eleven months only, is due to a request made by the managing director in India that the financial year in future shall finish at the end of March, instead of the end of April as heretofore. The working for the past season has resulted in a net profit of £728 2s 9d, after crediting the block account with the proceeds of tea sold from the Cootacovil Estate ; this profit the directors propose to write off the debit balance of last season. The coffee crop turned out fully 51 tons, and was the largest gathered for some years, and the directors were fortunate in having sold it at the high figure of 78s. c. i. f., before the great fall in the value of coffee took place. The pepper crop of about 14 tons was also sold for arrival at the satisfactory price of 45s 6d per cwt., whilst the first pluckings of tea, *viz.*, about 15 lbs., from the Cootacovil estate from the 1895 plantings, realised an average of 7½d. per lb. The net proceeds of tea, coffee, and pepper during the season 1898-99, after deducting proceeds of Cootacovil tea which has been carried to block account, amount to £3,957 2s. 7d. and the expenditure in India to £2,413 11s. 7d., leaving a credit balance of £1,543 11s. on the season's operations in India. The manager in India reports condition of the estates as most satisfactory, and that the tea leaf is coming in so fast that further machinery for rolling and firing is necessary. He expects to obtain more than his estimate of 78,000 lbs. for the current season. According to present appearances, Mr. Walker estimates this season's coffee at 18 to 20 tons, and the pepper crop at about 20 tons.

The prospects for 1900-1 are so promising that the directors confidently look for a yield of about 150,000 lbs. made tea, and a coffee crop of about 40 tons, whilst the pepper crop is likely to be quite equal to this season's yield. but, of course, these are only estimates which may be influenced favourably or otherwise, according to the weather. The directors have much pleasure in stating they have now completed arrangements with Messrs. R. and J. Henderson, of 7, Mincing Lane, E C., to finance the company as from April 1 last. These gentlemen have also undertaken to subscribe for the balance of the £8,000, 6 per cent. debentures not taken by the shareholders. The directors and Mr Walker have subscribed for £500 each. and the shareholders are now given the opportunity of securing a good 6 per cent investment with the option of turning their security into 10 per cent. preference shares any time prior to the date of repayment of the debentures. The acreage under cultivation remains the same as last year. Dr. Inman retired from the direction during the early part of this year, and according to the articles of association, Mr. J. C. Sanderson retires from the Board, and being eligible, offers himself for re-election.—*H. & C. Mail*, Oct. 27.

The Ceylon Land and Produce Company, Ld.—has a profit of £123,000. The directors propose a dividend of 15 per cent., and 5 per cent. bonus, making 20 per cent. for the year, and carrying £4,000 to Reserve.

The Central Tea Company of Ceylon, Ld.—pays 6 per cent.

The Neboda Tea Company of Ceylon—pays an interim dividend of 3 per cent.

The following dividends have been declared :—

Ceylon Land and Produce Co., Ld.—12½ per cent.

Lanka Plantations Co., Ld.—4 per cent.

Central Tea Company of Ceylon, Ld.—6 per cent.

THE PREVENTION OF COFFEE-STEALING.

At a meeting of the Legislative Council of Fort St. George, on the 14th instant, the Hon'ble Mr. Gabriel Stokes introduced a Bill to amend the Madras Coffee-Stealing Prevention Act (VIII. of 1878). We take a report of the proceedings from the *Madras Mail*.

The Hon'ble Mr. G. Stokes said :—

With Your Excellency's permission, I will now move, under Rule 34, that the Coffee-Stealing Act Amendment Act be read in Council. Under the rule the Council must discuss at this stage only the principle and the general provisions of the Bill. The principle of this Bill is the same as that of the Coffee-Stealing Act, and its general provisions merely supplementary to the latter. The Coffee-Stealing Act aims at the repression of coffee stealing by bringing the purchase, possession and removal of coffee under regulation. The present Bill adds nothing to its provisions as to removal, but it supplements them on the other two points. The necessity for this Bill arises in this way: while the original Act of '78 forbids the purchase of coffee or its receipt from any labourer, and in all cases requires that the particulars of purchase be recorded, it leaves the grower who sells coffee entirely uninterfered with. The owner of a coffee estate may sell his coffee and receive it without any question, and it is this freedom which has rendered the Act largely inoperative and it is this lacuna, which this present Act is designed to fill. Under the Act the definition of a coffee estate is "any land on which coffee is growing;" hence the squatter on the side of the road who owns a few coffee bushes is free of all interference. But these men are, and have always been, receivers of stolen coffee. That the Select Committee in the Act of 1878 should have overlooked this result is very surprising; for it is plain from the remarks of the Secretaries of the Planting Associations printed in para 151, Enquiry Committee's Report, that all the receivers in the Wynaad were then as now owners of coffee estates within the definition. It is, therefore, now proposed to amend the Act by applying to the growers of coffee in regard to their sales much the same provisions which already apply to purchasers under the Act. To the honest seller of coffee, as to the honest purchaser, these provisions need cause no anxiety or concern, but they will deprive the dishonest seller of the cover behind which he has largely sheltered himself hitherto. The provisions of the Act as to the purchaser, and of this Bill as to the grower who sells coffee, derive their efficacy from the fact that if a man's transactions are not honest they will not bear scrutiny, and that the honest man will neither fear nor resent effective scrutiny. Experience has shown that to make the machinery for this purpose of the existing Act as well as that of the proposed Bill effective it is necessary to take powers to require the grower who sells coffee as well to keep the books, etc., and to furnish the returns requisite to enable his transactions to be examined and to permit such examination. The necessary powers are given in the 7th Section of the Bill. There remains only one other point to notice. Under the existing Act, the onus of showing how he came by it is imposed on any labourer employed on a coffee estate found in possession of green-gathered coffee. In the Bill it is proposed to extend this provision as to possession to "parchment" and "cherry dried coffee" also. The reasons for this proposal are set out at length in paras. 170—172 of the Report of the Planters' Enquiry Committee which is in the hands of the Members of the Council, and it is unnecessary that I should recapitulate them. This amendment is embodied in Section 6 of the Bill. The motion which I have to make is that the Coffee Stealing Act Amendment Act be read in Council.

The Hon'ble Mr. Hodgson, in seconding the motion, spoke as follows :—

Your Excellency,—Perhaps few Bills to amend existing Acts that come before this Council have been subjected to as careful a preliminary investigation as this Bill to amend Act VIII. of 1878. I do not propose to go into the history of the defective making of the Act, or of the numerous appeals for its amendment. Sufficient to say that, as soon as it was made law, the defects became apparent, and appeals for its amendment have dated from the year 1878, one year after it became law, to the present time. The Madras Government, the District officials, the Police officers and the Planters have been aware of the necessity of amending the Act, and finally the Committee of Enquiry appointed by the Supreme Government have, after taking evidence from every side, advocated the amendments now before the Council and which form the basis of this Bill. The Bill does not introduce any new principle into the Act—the principle of the necessity of special protection for coffee having been thoroughly discovered and proved before the Act was passed in 1878. In the preliminary "interpretations," if you turn to the Act, you will find "coffee" defined as "all coffee not roasted or otherwise prepared for immediate consumption." And this definition is adhered to in the various Sections till we come to Section 9, when, for some quite unexplained reason, we find "coffee," confined to the definition of "green-gathered coffee." Now in the first place what does "green-gathered coffee" mean. Speaking as a planter who ought to know, I could not tell you. Does it mean green in the sense of fresh gathered; in which does it include "parchment" into which form the "cherry" is changed immediately after picking, and which is also therefore fresh gathered, or does it only mean the green, immature berry before it is ripe? In the first place, the definition is unnecessarily vague and in the second case you have the absurdity of protecting the coffee only in its immature stages, when it is of little value and utility to be stolen, and of having it unprotected exactly at the time when from its odour and the nature of the operations required for its curing it is specially liable to theft. This can hardly have been the intention of an Act, the whole sense of which is in the protection of a special product abundantly proved by the opinions of collectors and experts residing in coffee districts to need such protection. Why such an innovation in definition should have been introduced into this particular section, the operation of which is confined by its wording to employees on estates only, it is difficult to understand. It seems to me that in this particular Section, if anywhere in the Act, it was necessary to retain the wide definition given in the interpretation, and that had the words "green-gathered" been entirely omitted from the Section it would have been more consistent with the principle of the Act. I need not say, after what I have already said before, that I entirely support the insertion of the words "parchment or cherry dried" after the word "green gathered," though I cannot help thinking that the omission of the word "green gathered" from this Section would have been a better way of effecting the desired result. The other provisions of the Bill are to impose on sellers on coffee estates the duty of keeping registers of their transactions in the same way

buyers are obliged to do under Sections 5, 6 and 7 of the Act. I presume that owners of estates are the only persons who could possibly object to such extension of the powers of the Act, and the District Planting Associations have unanimously agreed to accept it. In para. 175 of the Enquiry Committee's Report, you will see it stated that there was "evidence to show that receivers of coffee almost always have a few trees, which they use as a screen under cover of which they can carry on illicit trade" and Mr. Fawcett gave an instance. From my own personal experience, extending over many years, I can state that this is only one of hundreds of similar cases, and that receivers nearly always protect themselves as this man in Vayitri did. The extension, therefore, of the powers of Sections 5, 6 and 7 to sellers, as proposed in the Bill, will greatly assist the Police in the detection of fraudulent transactions and will greatly increase the effective working of the Act. These are some of my reasons for supporting the Bill.

The Hon'ble Mr. Vijayaraghava Chariar, in supporting the motion, gave a brief history of the legislation. From feelings of admiration and sympathy and also from motives of dim self-interest, he supported the motion. The success of the persistent agitation to obtain special laws on the part of European planters was pregnant with lessons for Indian politicians and was fraught with hopes; whether the hopes were to be realised in the near future or distant future was another question. He suggested that now that the old law was to be amended, steps might be taken to omit from it two objectionable Sections, *viz.*, the one relating to the infliction of corporal punishment, and the second relating to the awards of rewards to informants. It was desirable to expunge the first Section inasmuch as corporal punishment had come to be looked upon as a barbarous thing in itself, and, with the advance of enlightened ideas, they had ceased to use it as an instrument of discipline even in the Army. It was very doubtful whether in the interests of planters and coolies the provision relating to flogging should be retained. As to award of rewards to informants the system had been condemned as demoralising.

The motion was then put and carried.

The Secretary then read the title of the Bill which, on the motion of the Hon'ble Mr. Stokes, was unanimously referred to the following Select Committee:—The Hon'ble the Acting Advocate-General, the Hon'ble Mr. C. Jambulingam Moodelliar, the Hon'ble Mr. H. P. Hodgson, the Hon'ble Mr. F. A. Nicholson and the Hon'ble mover of the Bill.

TEA IN NEW SOUTH WALES.

Referring to the store of Mr. James Inglis, of Sydney, whose business has lately been converted into a Joint Stock Company, the *Clarence and Richmond Examiner* says :—

During a recent trip to Sydney we were privileged to be piloted through the extensive works by the genial ex-Minister himself. We were astounded to find such a busy hive of industry in such unpretentious-looking quarters. Down below in the extensive cellars are casks, and bins, and hogsheds, and cases full of the rarest wines and the most matured liquors. On the various floors are piled huge stacks of chests and half-chests and boxes of the fragrant teas of China, the strong aromatic growths of India, and the rich golden-tipped leaf from the far famed isle of spices.

The largest distribution of tea in Australia is directed from this enormous and well-selected stock.

The spacious tasting room, with its burnished brass kettles merrily steaming all the day; its rows of natty little tasting cups and pots; its tiny heaps of tea samples, spread on the black tables in seeming disorder, yet all of which undergo a most careful scrutiny by a trained staff of experts; and the walls hung all round with the most beautiful and complete collection of photographs, showing every detail of tea growth and preparation, forms a complete object lesson in itself, and is of surpassing interest from a commercial education point of view. The bustling din from the packing rooms mingles with the merry chatter of pleasant voices, as the girls deftly pack the fragrant blends into the well-known packages that are everywhere the delight of tea drinkers throughout Australia.

A busy hum comes from the machinery upstairs, where all day long many operations necessary to prepare the enormous daily output of the business are conducted. On the various blending floors as much as from two to three tons of tea are frequently spread out at one time, and the flashing shovels of the blenders gleam, as one may have seen in a great malting house. Here, too, driven by machinery, we come on the familiar printing press, for the firm does all its own printing, and turns out monthly publications, advertising sheets, labels and wrappers, amounting to some millions in the course of a year.

On the opposite side of the lane three or four American mills revolve with a merry rattle, and here the operations of coffee roasting and grinding. In another large apartment are stacked large shipments of shooks of Japanese boards, cut into the proper lengths in Japan, and brought down from there swathed in bandages of rice straw, and here several carpenters are engaged in making the myriads of boxes and crates that carry the popular preparations of the company to all parts of the compass. This is the only instance in which local products are not used, the local timber not being suitable for tea-packing.

The whole place is indeed what we have called it, "a typical hive of industry," and it is with more than ordinary pleasure that we commend the busy firm to the suffrages of our readers and wish long success and still wider demand for

THE FAMOUS BILLY TEA.

THE TEA INDUSTRY.

The social power of a cup of tea finds its highest expression in the Cha-no-yu of the Japanese, its reflection in the 5 o'clock tea of the English, and a suggestion in the dull ceremonial visits of Americans. The magic influence of the infusion of the famous plant has spread from the East across seas and land in spite of edicts, anathemas and taxes and ingratiated itself, first, with kings and queens, then, by royal favour, with the nobility, slowly, as its cost was lessened, with the people, until to-day it is a favourite beverage in the United States, Great Britain and Russia, where admiration for the leaf is almost as much of a passion as in China and Japan. The Samovar and the tea-pot are as typical of life under the Czar and the Queen of England as the tea-kettle is indicative of life under Japan's Emperor or the Empress of China.

Somehow the earlier generations of New Englanders and Virginians were greater devotees of tea than their descendants, whose per capita consumption has been less during the past thirty years than it was when the wrath of the colonists over a century ago, at being taxed without representation, led them to toss tea into the Atlantic, or in other ways destroy the leaf.

The total tea trade of the United States does not amount at wholesale to $20,000,000. And yet few articles engage greater attention or have a more marked interest for the purveyor than tea. The average net imports into the United States during the five years ending June 30, 1899, was 88,642,849 pounds, of which China supplied 54.22 per cent., Japan 39.82 per cent., India, Ceylon and all other countries the balance.

Thirteen years prior to the advent of the *American Grocer*, in 1869, the first invoice of Japan tea arrived in the United States. Its popularity grew amazingly fast until now it equals three-fourths the quantity received from China. To-day, however, the machine-made tea of India and Ceylon bids fair to repeat the history of Japan tea. In 1892 the first of these teas was received, and slowly but surely the demand has grown until now 14,000,000 pounds reach the United States and Canada.

Across the Atlantic our English cousins have about driven out China tea, which in 1837 constituted the entire supply. In 1887 India and Ceylon furnished 51 per cent. of English requirements, while in 1898, out of a total import of 235,414,105 pounds, India and Ceylon furnished 215,902,096 pounds. During the last ten years Australia has displaced 50 per cent. of the imports from China.

In March, 1869, the bark *Formosa* landed 7,800 half chests of Formosa Oolong tea, the first ever received. They were shipped by Mr John Dodd, an Englishman, who was the pioneer in the Formosa tea trade. The island at that time was almost entirely in the hands of savages. Mr. Dodd first visited the island in 1862 and found the tea plant growing wild—the trees from eight to ten feet high with leaves about four inches long. He carried the leaves to Amoy, China, where the tea factors ridiculed the idea of making tea from such plants.

Mr. Dodd, however, had faith in his ability to succeed in cultivating the plant and in 1866 he sent to this country sample lots of the most delicious Oolong tea ever received here. The tea was

cultivated on virgin soil and was very different in flavour from that produced in the old gardens of China. The entire first cargo was sold to the trade for from 85 cents to $1·00 per pound. The next year the finest Formosa brought $1·30, the importers realizing a profit of 60 per cent. on their venture.

From the plant *Thea sinensis* are derived all the various sorts of tea known to commerce. The illustrations tell better than words the appearance of the leaf and the appearance of a tea plantation during the picking season; the characteristics of the pickings. Peasants in picturesque dress are adepts in plucking the tender leaves from the ends of the shoots, which are conveyed from the field in baskets. The field master, tally book in hand, keeps record of each picker's work. The leaves are taken from the field by the natives, who carry a poke on the left shoulder with a basket of leaves suspended from each arm.

TEA—ITS COMMERCIAL VALUE.

The price of tea in primary markets is determined by flavour, aroma, style of leaf, the strength, body and colour of the infusion. Differences in leaf are due to either natural or artificial causes, or both. Natural causes influence flavour rather than style or appearance. Variations in the character of soil and climate cause variations in the character of the tea leaf, and it is these differences which lead to the distinction between teas grown in different sections of the same country.

Artificial causes change the appearance or style of the leaf, and affect flavour. These are curing, firing, colouring and manipulation, whereby colour is changed or artificial flavours imparted by the use of other sorts of tea upon some one distinctive sort. As consumers are influenced wholly by appearance or flavour, dealers waive the consideration of the physiological value of the leaf as determined by chemical analysis.

The aroma of tea is due to the presence of a minute quantity of essential oil, which is more or less affected by the curing process, and which also causes change in the quantity of tannin. It is volatile, so that great care is necessary in order to preserve aroma. Fermented or black teas, such as the Oolong, Souchong and Congou of China growth, have less of tannin than unfermented leaf. It is also claimed by chemists that fermentation retards the solution of tannin and other extractive matters.

There is no relation between the commercial and chemical estimate of tea, as is proven in the elaborate tables of analysis of the teas of commerce, made by Joseph F. Geisler, Ph. D., published in the *American Grocer* (October 23, 1884), and in Prescott's "Organic Analysis," (pages 504—512).

Artificial flavour is given to the leaf by the use of aromatic flowers, such as the blossoms of the orange tree, jasmines, *Gardenia florida*, *olea fragrans*, *Magnolia fuscata*, *Chloranthus inconspicuous*, *Illicium anisatum*, *Prunus mume*, *Daphne odora* and various sorts of roses.

The scenting of tea is quite an art, and one at which the Chinese are adepts. The flowers to be used are mixed with the prepared leaf, and left for a day, when they are removed by sifting, fanning or picking, after which any acquired moisture is removed by drying. The scent grows stronger after the tea has been packed, and is retained by the leaf for a year or longer.

The distinctive character of teas having an obnoxious natural flavour cannot be hidden or removed by the use of scented tea, the addition of which would probably make an inferior tea worse rather than better. The leaf is also very susceptible to moisture, and is very sensitive to foreign odours, which are readily absorbed.

The tea of China is divided into two sorts, viz., black and green, they, in turn, divided into a general classification of sorts or grades, and again sub-divided as to their place of growth and manner of curing.

Taking green, we find them designated after the districts as Moyune, Tien-Kai, Fychow, Taiping, Pingsuey, and formerly, Canton, which latter designation has fallen into disuse in this country. These sorts are again divided as to their quality and appearance, into Gunpowder, Hyson, Young Hyson, Imperial Hyson-Skin and Twankay.

The black is a general designation for three classes—Congou, Souchong, Oolong. The Congou family is a large one, but little used in the United States, and less to-day in England than a few years since, being displaced by India and Ceylon teas.

Adopting an English classification we have the Congou divided into three sorts—Black Leaf, Red Leaf, and Tayshan, or new make. The Black Leaf are again divided into Moning, Ningchow, Oopack, Oonfa, Siangtam, Kiukiang, Cheong-sowkie, Hokow.

Red Leaf is designated as Kaisow, Chingwo, Pakling, Ank Saryune, Amoy, Flowery Pokoe. The Oolongs are known as F mosa, Amoy, Ning-Yong, Koken, Padre, Foochow.

We might class the Pekoe with Oolong, but many put them i group as scented tea, and classify as Scented Orange Fooch Scented Orange Cantons. There is also Scented Caper.

We have only outlined the general or common names, becau they have changed greatly and are liable to change.

As an instance of the great variety, let us take the Oonams belonging to the black leaf sorts, and they are called Oonfa, Cheo Sow-Kie, Siangtam, Li-ling, Low Yong, Pon-Kiang, Nip-Kar S Wunki, Yang-low-see, etc.—*American Grocer.*

RECIPES.

To Destroy American Blight and other Plant Lice.—The use carbon disulphide is recommended, the affected places being da ed with a rag tied to the end of a long stick. The application m be repeated every eight days. A simple method is to sprinkle t affected parts with diluted petroleum. No ill-effects have, so f been noticed from this treatment. A dilution of 1 litre of pet leum to 4 or 5 litres of water may be used as long as it is conti ally shaken up. The process of extinction can only be consider complete, when every trace of the bluish-white web, in which t insects are enveloped, has been destroyed. Autumn is the b season for waging the campaign, when the trees are bare; later, spring, the bluish-white web disappears, and the pests are th scarcely discernible. It is useless to attempt their destructi unless it can be done thoroughly, as the smallest remnant l multiplies to an alarming extent.

Destruction of Phylloxera—Bordeaux mixture is rapidly prep ed as follows:—Water, 90 litres, is put into a wooden or earth ware vessel, and copper sulphate, 2 kilos., dissolved in it; 700 g to 1 kilo. of freshly-slaked lime is mixed carefully with 10 litres water. This is gradually added with continual agitation to the c per solution; a turbid blue mixture results, which becomes clear standing. If still blue, more milk of lime should be added until t solution is quite colourless. Sprinkle the vine with this solutio The solution destroys the phylloxera, but has no lasting effect, that the application must be repeated several times during t summer.

Petroleum Emulsion.—Train-oil soap, 2·25 kilos, is dissolved 45·4 litres of boiling water, petroleum, 2·25 litres, is added, and t mixture diluted to 227 litres with hot water. Wash or spray wi the lukewarm solution.

Krueger's Petroleum Emulsion.—Black soap, 250 gm., is dissol ed by boiling in 4·5 litres of water, and petroleum, 9 litres, is add when the soap solution is removed from the fire. The fluid is th agitated well for 10 to 15 minutes.

Nessler's Remedies for American Blight.—(1) Soft soap, 40 gm amyl alcohol, 50 gm.; methylated spirit, 20 gm.; water, 1 litre. Soft soap, 30 gm.; sulphurated potash, 2 gm.; amyl alcohol, 3 g to water, 1 litre. (3) Soft soap, 15 gm.; sulphurated potash, 29 g to 1 litre of water.

Destruction of Rats.—(1) Precipitated barium carbonate, 100 g and tartar emetic, 1 gm., are mixed with baked flour and glycer in 2 gm. into boluses, which are fried brown in hot fat. (2) Gypsu 2; oatmeal 750; flavoured with anise oil. (3) Plaster of Paris a sugar, equal parts. The mixture is spread on a plate, and expos near a vessel of water. (4) Crushed bitter almonds, 60; lard; tre squill bulbs, equal parts, (5) powdered almonds mixed with arse answer well.

Rat Cakes.—A bulb of squill is cut into thin slices, dried a mixed with sugar, flour, and a little salicylic acid. Make i cakes with glycerin and with sugar, and expose them by the side the water.

Moth and Caterpillar Lime.—Venice turpentine, 200; resin, 1,0 turpentine, 140; tar, 80; lard, 500; rape oil, 240; tallow, 200. Resin, 50; lard, 40; stearine oil, 40. (3) Resin, 3; rape oil, 4; la 2; soft soap, 1; wood tar, 1. (4) Resin, 36, rape oil, 36; Veni turpentine, 20; wood tar, 5; turpentine, 3 parts. Paint the mixtu while warm on strips of paper laid smoothly on the tree-trunk abo a yard above the ground. This should be done at the end October, or the end of November, to prevent the females of t winter moth from climbing up the trees. (5) Instead of abo mixture, cart-grease may be used. (6) Mix melted resin with cru rape oil to form a mass of sticky consistence.

INDIARUBBER IN QUEENSLAND.

The following, from the *Brisbane Courier*, will be of interest to some of our readers :—

"The news from Cairns that a number of local men are arranging to begin operations in the manufacture of indiarubber is important. The raw article can be obtained from indigenous trees in the shrub, and is said to be of first-class quality. What is perhaps more important, the supply is inexhaustible. One of the chief values attaching to the recent New Guinea concession was the practically unlimited quantity of rubber there obtainable. To find, therefore, that a similar condition of affairs exists within easy distance of a port like Cairns is to say the least encouraging. Then, as regards the industry itself, its outlook is as bright as it possibly could be. The marvellous demand for bicycles of late years has given an immense impetus to the rubber trade. Indiarubber being also a highly perishable article is another important factor in the question of supply and demand. The demand will always exist, so the supply must be kept going. There is one consideration, however, which these Cairns men will find obtruding on their notice sooner or later. That is the question of chief labour in collecting the article. This must be considered when it comes to competing with others. In New Guinea, for instance, labour is cheap and on the spot. Here in Australia we have practically none of this native labour. The nearness to a port for shipment may counterbalance this advantage which New Guinea rubber traders would derive from a handy labour supply. Our Department of Agriculture has during the year been trying by a series of articles to direct attention to this industry. Its progress will be watched with much interest. It will also place another string on the Cairns bow in raising that town into a place of much importance in the future."

A NEW PACKING MATERIAL FOR FRUITS.

The *Gardeners' Chronicle* says :—

An interesting experiment has just taken place in the matter of packing fruits in the colony of Victoria for shipment to England.

As is pretty generally known, apples and pears are now brought from the Cape of Good Hope and from the Australian colonies in boxes holding a bushel, which are stored on boardship in cool chambers. These chambers, or refrigerators, have been provided by the steamship companies at a considerable outlay of money. The fruits are merely wrapped in tissue, and placed in the boxes.

Under this system, apples have for the most part come very successfully; but pears have been less satisfactory. Occasionally, there have been pears from the Antipodes that have reached this country in a sound condition, but numerous consignments have proved to be of little value, and the commission-agent is never able to speak of such fruits or to gauge their value until they have been unpacked. The freight per bushel from Victoria to London for apples or pears so packed and stored on boardship in cool chambers is 3*s*. 9*d*.

Such are the circumstances of the present system, and the amount of freight paid for passage.

And now for the experiment, for intelligence of which we are indebted to Mr. J. B. Thomas, a well-known fruit salesman in Covent Garden, to whom the fruits, which have been the subjects of experiment, were addressed.

Instead of packing the apples wrapped in tissue only, in the case of several bushels that have recently arrived in London by the S.S. *Wakood*, a quantity of asbestos or a preparation of this substance has been used. The fruits were wrapped in tissue as formerly, and afterwards embedded in the asbestos, each fruit being perfectly surrounded by this substance. Upon unpacking the case, the asbestos appeared to be caked, but it was easily broken up, and then appeared almost like flour. We should suppose, therefore, that the fruits would be airtight under such conditions, and this will account for the fact that as we saw them they were perfectly sound, and in excellent condition, although five months had elapsed since they were packed in the boxes. The apples were grown by Mr. J. R. Warren, Mount Alexander Orchard, Harcourt, and Mr. J. M Ely, Rosehill Gardens, Harcourt, both large Victorian fruit-growers. They were packed and brought to this country under the direction of Mr. Geo. Pontin, Church House, Yapton, Sussex. The apples were gathered and packed previous to May 5 last; but, owing to some objection, we believe, on the part of the steamship companies, there was a delay of two months or more before shipment, and even then they travelled by the Cape route. The companies, naturally perhaps, object to the introduction of a new system of packing fruits that may render unnecessary the cool chambers that have cost so much money to provide. But such objections will, no doubt, be overcome, and if a syndicate be formed, as is now proposed, the system will be given a conclusive trial. The new system, should it answer to expectations, will possess several advantages. The fruit may then be stored in the "hold" of the ship, and the freight per bushel-case will be 6d. instead of 3s. 9d.; but as the packing material will displace a quantity of the fruits in each package, it may be well for present purposes to describe the future freight of the fruit a 1s. per bushel.

It must be remembered also that the asbestos is a valuable material in England, and it will be sold here to as much advantage as will the apples. The result will be that the asbestos and fruit would be brought to England for less money than is now paid for the fruits alone. The apples will travel as well or better, and it is thought they may be preserved after arrival here for weeks if necessary, providing that the cases be not opened in the meantime. And, beyond the other considerations, it is hoped also that Victorian pears by this system may be placed on the English market without much risk of loss by decay.

REFORM IN THE TEA TRADE.

When a well-known dealers' organ, such as *The Produce Markets' Review*, attacks current London charges on tea, and urges dealers and importers to bring about a reduction, its words must be of considerable interest to planters. Our contemporary's criticism is severe, and, though its arguments are somewhat lengthy, we make no apology for quoting the whole of its remarks in full, for there is food in them for very careful thought, especially at a time like the present, when the subject dealt with is prominently under the notice of the various Associations that represent the tea industries of India and Ceylon.

The *P. M. R.* says :—

DOCK CHARGES.

Some time back we printed a short comparison of the charges made by the London Docks and Wharves upon Tea, especially upon Indian Tea as compared with Indian Coffee. We now append a fuller table of the charges on each, calculated so far as possible upon the same basis, and it will be seen that a ton of Tea costs £4 0s 2d, and the same weight of Coffee costs only 17s 2d, or less than a quarter of the charge on Tea.

DOCK AND WHARF CHARGES ON INDIAN TEA IN LONDON.

Charges on one ton of Indian Tea landed and sold at public sale, taking 20 chests to a ton :—

	£	s	d
Landing and Housing Rate, 1s 6d per chest ...	1	10	0
Public Sale Charges, 4d per chest	0	6	8
Bulking and Taring each chest, 2s per chest ...	2	0	0
Thirteen weeks' rent, ½d per chest	0	10	10
	4	7	6
Less 10 per cent. ...	0	8	9
	3	18	9
Weight Notes	0	0	8
Warrant Stamps	0	0	9
	£4	0	2

NOTE.—The Landing and Housing Rate comprises: Landing, wharfage, housing, separating into chops, weighing, average taring, furnishing landing weights, examining and turning out and in for damage, mending, laying down for private inspection, lotting, nailing down, placing in delivery pile, and delivery by land.

DOCK AND WHARF CHARGES ON COFFEE IN LONDON.

Charges on one ton (16 bags) Indian Coffee, for the same period as Tea, sold at public sale.

There are no charges for arranging Coffee for public sale.

	s.	d.
Consolidated Rate, including bulking and sampling, 8½d. per cwt.	14	2
Sorting and Lotting, 1¼d. per bag	1	8
* Seven weeks' rent, 6d. per ton ...	3	6
	19	4
Less 12½ per cent. ...	2	5
	16	11
Warrant Stamp ...	0	3
	17	2

If there is no bulking done the consolidated rate is 6d. per cwt.

The Consolidated Rate includes: Landing, wharfage, weighing, gross, mending, housing, or piling, accounts of landing weights, original warrants, * six weeks' rent free; weighing on delivery, and delivery.

Lest it should be thought that the comparison with Coffee is of an exceptional nature, we have compiled the following table, showing what the charges are for the consolidated rate on other articles of grocery produce, and it will be seen from this how enormous is the surcharge upon Tea:—

CONSOLIDATED RATES PER TON ON VARIOUS GOODS COMPARED.

	s.	d.
Indian Tea (placed on about the same basis) ...	56	0
Coffee	14	2
Refined Sugar	4	6
Currants	7	6
Valencias (½-boxes)	12	0
Tapioca	8	6
Rice	3	9
Salmon (in tins)	4	0
Sardines	5	6

It seems to us impossible to account for the extraordinary difference in the charges upon tea, except on the supposition that an antiquated system of business has lasted longer than in any other goods, owing to the absence of competition, and of modern methods of trading in tea. Thirty years ago, the wholesale price of tea in bond, on the average, exceeded 1s. 9d. per lb, while it is now less than 8d.; and, probably, if we went back sixty years, the difference would be still more striking. Yet, as compared with the charges of a generation ago, we believe the dock and wharf rates on tea in London to be, if anything, higher than they were then.

TEA BONDED WAREHOUSES.

It is always said that competition is the life-blood of business; but if so, the tea warehouses are in a bad way, for there is no competition whatever between them. A good many years back the system of secret discounts to importers was introduced, which was responsible to a very great extent for the cutting down of the wages, which led to the great Dock Strike of ten years ago. The system of discounts is in itself a most objectionable one, for there can be no object in sending a bill for £100 and on a subsequent occasion returning £10 or £25 out of it, unless it be that the original invoice is intended to be forwarded to some one who is not to receive the discount. After the Dock Strike, the dishonest nature of the system became so apparent that the Dock Companies felt themselves obliged to publish their discounts in their rate books, so that the Tea growers, when they sent Tea to this market, could have an opportunity of seeing that only the proper prices were charged to them. The publication of the discount, however, was with the condition that it should not be given away, so that beyond the Tea planters knowing that they are charged 10 per cent. more than their agents really pay, there is no gain to them in the publication, as is the case with similar pickings in freights and insurance charges.

TEA CLEARING HOUSE.

In order to bring about greater fixity in the charges on Tea a sort of Trade Union was formed, at the time we speak of, between the importers, the warehouse-keepers and the wholesale trade. By this arrangement a Clearing House was established, which somewhat facilitated the daily work of getting Tea through the Customs, and the members agreed, first, that they would only buy Teas lying at specified warehouses, and secondly, the warehouse-keepers agreed that they would only charge certain rates, allowing a discount, first, off the importers' charges, and secondly, off the dealers' charges in both cases on the conditions that these discounts should n given away. The Board of Customs was also brought upo scene, and has since practically refused to fully license new Tea warehouses, so that, as a matter of fact, it is practically i sible at the present moment to obtain a new bond for the ware ing of Tea in London.

The result has been unsatisfactory, though at the time we tended, because the object was to protect the minimum wag the dock labourers. This combination has now clearly be injurious owing to the changed circumstances of the case. distributor can no longer afford the enormous charges made, the whole trade, whether importers or wholesale or retail d butors, recognise that the cost of distributing Tea is enorm out of proportion to that of distributing any other article of gr produce. After carefully considering this question, we can arrive at the conclusion that this state of things is due simp tradition, and that simplification and much greater cheapnes possible in dealing with tea.

CUSTOMS RESTRICTIONS AND SUPPORT OF THE COMBINE.

The first step towards modernising the tea trade is to ob greater elasticity in the Customs regulations. In the first p what reason exists for insisting that the duty on tea shall on payable at bonded warehouses? It is obvious that this at limits the trade to those happy warehouse-keepers who were parties to the tea-clearing warehouse scheme. So far as we judge, there is no reason whatever why the Customs should gladly welcome the payment of duty on tea over the ship's sid is (we are told, but we do not know) the practice with other g A covering amount should be paid as the cargo was put over lighters, and an officer should then attend at the destination o tea (at the cost of the owner, of course) and collect the balan any be due, or return it if the duty be overpaid. To the com cial mind it appears that this would be an obvious gain to Revenue; but the authorities, on the other hand, appear hith to have thought it more advantageous to insist on tea being w housed—to take charge of it in detail, and to look after each p cular chest for months and years at a time. It is quite clear until our present restricted tea warehouse system is broken thro our Indian and Ceylon planters will not have a fair chance in matter of charges. They should at once bring pressure public bear on the Customs, to insist on sufficient new bonds being gra to ensure free competition in tea warehousing—at prese highly profitable monopoly.

The *Investors' Review* has lately shown in a series of articles largely the planters' agents in this country are interested as ow or shareholders in tea warehouses, and therefore in the mainten of the present system. The matter will thus be a difficult on fight, more especially as the wholesale tea trade have also bec interested, through the discount system, in the maintenance o existing plan. We think, however, they are open to reason on matter, for their gain from this source is absolutely trivial w compared with the complications and high cost of the syste selling tea, which are rendering the wholesale tea trade so diffi

WEIGHT NOTES AND WARRANTS.

Apart from warehouse charges in themselves, there are m details in the working of the trade which are quite of an except and unnecessary character. There has been no change in number of packages entered upon a warrant since the time that was three times its present price, and this seems simply abs The old system was to have six chests upon a warrant, and present proportionate document, therefore, should have placed it eighteen chests or thirty-six half-chests, as representing the mer value of a much smaller number of packages. The warra Tea is still accompanied by a weight note, a system which has given up in every important branch of the grocery trade, thou is still kept up in some minor commodities such as spices. issuing of a weight note, of course, means that the work in con tion with Tea is done twice over, for which there can never been any reason that we can see, but which is, at any rate, a si waste of time and of money at the present moment. We are a that the weight note in its present form is considered to be ne sary as a security for the deposit paid on the purchase of We are not, however, aware that any particular sanctity is atta to the deposit system in itself, as it also has been abandone the large grocery trades. Supposing it, however, to be contin security might readily be given by a coupon attached to the

rant. The weight notes are not only unnecessary in themselves, but they embody an immense number of equally futile details. For instance, they give full import particulars in excessive detail, either in writing or printing, which also appear on the warrants. In addition to this, the weight note is supposed to bear three separate signatures, and often does so, and it then forms a separate contract for the sale and purchase of each six chests, being signed by all the parties. In addition to this, each weight note works out, in detail, for every six chests of Tea, the weight and price at so much per pound. From this result the deposit is deducted separately, and the lot money, 4d., is then separately added to the total. The weight notes give the particulars of the country of origin of the Tea, the name of the importer, the date of importation, the variety of Tea, the name of the ship, the name of the captain, the port of origin, the name of the selling broker, the date of sale, to whom the warrant is issued, the date of the prompt and of the commencement of rent. Several of these particulars are repeated twice over upon this valuable document—the weight note—though they all appear on the warrant also. What could be more childish and absurd than all this? There is no doubt that a very considerable economy in money may be effected by enlarging the number of packages on the warrant and by abolishing the weight note altogether. This is a simplification which forms, in our opinion, the initial step towards the cheapening of the distribution of Tea. To those accustomed to modern systems of trading, the weight note appears simply a farcical, though unfortunately a costly, absurdity. If the Coffee trade can be conducted with the utmost ease without such documents, why cannot the same be done with Tea?

DELIVERY ORDERS FOR CLEARING.

Further great simplification might be caused by using delivery orders for clearing and delivering Tea, as is done in other trades. There is, however, a considerable practical difficulty in this matter in the case of Tea. Many years ago Mr. Gladstone, as Chancellor of the Exchequer, in one of his great Budgets freeing trade from Customs imports, unfortunately made a detailed change which has worked a great deal of mischief, by imposing a penny stamp on delivery orders for goods issued on warehouses where rent is taken. Tea at that time was delivered in great detail to the retail buyers, who kept stock in bond in London, often for long periods, in the charge of the wholesale dealers. This system still continues, and the quantities in which Tea is cleared are proportionately smaller than is the case with other articles of grocery produce. Representations were made to Mr. Gladstone as to the injurious bearing of the penny stamp on delivery orders in the case of Tea, and it was agreed that the warrant stamp of 3d. should, as a compromise, cover all deliveries made on the face of that document. It has been argued over and over again at the Board of Inland Revenue, that the stamp having been paid on the warrant as a compromise for separate deliveries, a penny stamp should not be required when separate pieces of paper are used for delivery orders, instead of the deliveries being written off on the warrants themselves. The authorities at Somerset House, however, held a different opinion, and it has not been considered worth while to go to law to test their right to make the charge, though it appears to be very doubtful. The result of this is the maintenance of an extremely complicated system in the clearing of Tea. The warrant, with the order to deliver, written upon it, has to be lodged at the Clearing House, from whence it is sent on to the wharf, and subsequent to the delivery of the Tea, the warrant is returned to the Clearing House, from whence, in due course, the wholesale dealer fetches it back. The delays and expense caused by this little obstacle to business, devised by the perverse ingenuity of our Revenue departments, are inconceivable to those who have been accustomed to the broader, easier, and far cheaper system used with all other grocery goods. If it were not for this stupid piece of obstruction on the part of our Government to a rational system of delivery, there would be no necessity whatever for such an institution as the Clearing House, and the home trade would not only move as smoothly again but be conducted at much less cost.

DELAYS IN GETTING WARRANTS.

The warrants and weight notes are not only obsolete and obstructive in themselves, but there is a quite objectless delay in obtaining them. In all other trades that we know of payments for warrants as they are required are made to the actual holders of the documents. A notice is sent them in the morning that such-and-such warrants are required. They are at once sent on by hand to the applicant, and handed over in exchange for a cheque. In Tea, this is not the case, and endless loss of time and temper results. The importers should do one of two things: either trust their brokers with their warrants if they cannot manage the details themselves, or else accept direct payments. There can be no doubt that the second is the proper plan to adopt, and it is surprising that the wholesale Tea trade have not long since insisted on the removal of this great hindrance to business. It is true that a poor compromise was adopted some years back, by which it was arranged that, when payments were made to the brokers before noon, the brokers would procure the warrants from the merchants by 2 P.M. This plan constantly leads to a day being lost in the delivery of Tea, to the loss of both the wholesale and the retail buyers. We are, of course, fully aware that one cause of these delays is the fact that such a large proportion of warrants are pawned by their holders. When they are their own property there is no more objection to this than to any other legitimate pawnbroking operation. But when the pawners are not the owners of the goods other considerations arise, and after the sale of Tea, the original owners have no more right to leave it in pawn than they have to mortgage some one else's house.

THE PUBLIC SALE SYSTEM.

The system of disposing of Tea almost exclusively by public sale lends itself to much criticism. It will be seen above that the cost of arranging Teas for public sale is no less than 4d. per chest, so far as the docks and wharves are concerned. For the work done, the charge is not out of the way, but the question is whether the whole system might not be greatly simplified and more closely approximated to other cognate trades. First, there is the payment to the brokers for the hire of rooms, and for the printing of the catalogues, and for their distribution, often to a very unnecessary extent. Tea catalogues are printed in a different way to those current with other groceries. We do not know whether the system of printing and the sort of paper is more or less costly, but this deserves looking into. There is one very obvious source of waste in Tea catalogues, which are often very small documents, but in which two pages are always given, first for the names of the brokers and rough particulars, and next for the conditions of sale, which are given in full in every catalogue. These particulars it is surely unnecessary to print in every catalogue in detail, especially when, as they often do, they take up from 20 to 50 per cent. of the paper used. The catalogues are not, it is true, in such minute details as was the case years ago; but it is questionable whether this does not still admit of a great deal of simplification.

The brokers' charge for public sales, in addition to their brokerage, is 9d. per lot of six chests. It would be interesting to compare this with the public sale charges on other Mincing-lane produce, and the materials could easily be collected. On 2,00,000 chests a year sold publicly, 9d. for six chests represents a cost of £11,000.

A great deal of the work connected with catalogues is due to the separation of the Teas into miserable little lots, which are supposed to be of different qualities, though the Teas are very frequently all plucked at the same time, from the same bushes, and on the same gardens. Owing to the inefficient appliances in India, Indian Teas have, as a rule, to be rebulked in London, and while this operation is being conducted, we feel sure it would be in the interests of everyone concerned—planters, importers, and dealers alike—to put an end to these separations, and to make larger breaks for one average sort of Tea. The cost to the wholesale trade of distributing these trifling lots is out of all proportion to the profit to be obtained upon them. Probably the old days when China Teas reached us in breaks of 300 to 600 chests, which could be judged of by a single small sample, will never return, but the Indian Tea trade will never be in a satisfactory condition until a minimum parcel of one quality should be represented by quite 100 chests. This cannot be done till Teas are bulked at the gardens, and so tared that each chest does not require to be turned out here for separate taring, at an enormous cost to the grower, which only entails unnecessary labour on the home trade, with no advantage in return.

HUGGER-MUGGER AUCTIONS.

The system of sampling the public sales on the part of the trade is a very cumbrous one. In other businesses the samples are on show in the broker's sale rooms, but that is mostly in the case of commodities where elaborate tasting is not so essential as it is in the case of Tea. It has been suggested that it would be more convenient if the public sale samples were sent

round to the trade in time for the sales, by the bonded warehouse-keepers and payment taken for them at some average price, or so many pounds of "returns" given. At present the whole number of the representatives of the wholesale dealers attend at the different bonded warehouses, and the supply of the separate samples to them creates an immense amount of expense and of waste of time We do not suggest this as a definite solution, but only as one that might be considered, now that the new Tea Buyers' Association is engaged in going into all such questions As it is, the time allowed the trade for valuing is quite insufficient, and only the largest houses can cope with the samples, and then only hurriedly. The interests of growers must often be seriously affected by this excessive haste.

As we pointed out some time back, it appears certain that much of the present great depreciation in the value of Tea, as compared with former years, is due to the system of unrestricted public sales. Whether the Teas are or are not wanted, they are pushed upon the market in constantly increasing quantities, and fall to a dead level in price in consequence, because it is not worth while for anyone in this country to stock more Tea than they can possibly help. It is our firm conviction that what the Indian Tea planters have been long trying to do, that is abolishing what they erroneously call the Mincing-lane monopoly, is the source of half their troubles. In former days, when the varieties and qualities of Tea were far less than they are now, it was worth the while of an intermediate class, acting as merchants here, to buy up suitable Teas, and to wait for markets, so that the prices were equalised At present this class of dealers practically confine themselves to hand-to-mouth purchases, for they can always get plenty of supplies at auction, and there is no reward whatever for holding larger stocks than are sufficient for a few days' trade. So far as we know, there is no other article whatever, which taste and fancy so largely enter into, which is sacrificed in the same way as Tea is, in this hugger-mugger without reserve system. In years past we have strongly advocated public sales for Tea, as the only way to fix values, and to this we fully adhere, if they are supplemented by large private transactions, conducted in a more leisurely way. The Indian and Ceylon trade can never be on a satisfactory basis until the public sale system is largely supplemented in this fashion.

BULKING AND TARING IN INDIA.

We alluded above to the great cost inflicted upon the Indian planters, through the necessity for bulking and for separately taring their Teas in this country. Some progress has been made with regard to bulking abroad, but it is inconceivable here why the system has not become universal Years ago we heard the old excuse about the dampness of the climate and the difficulty of keeping Teas; but if the facts are as alleged, the difficulty can easily be remedied by such simple appliances as hot water pipes. Then again as regards the taring of the Teas, the smaller gardens no doubt have to rely on rough native labour, and this is given as an excuse for the chests not being cut to scale The excuse seems to us totally insufficient, and we can only ascribe the continuance of the existing system to ignorance. In these days when metal chests can so easily be obtained, as well as the beautifully made "Venesta" and other artificial wood chests, uneven tares seem simply inexcusable. It pays our Sugar refiners to import ready-cut wood for such a cheap commodity as theirs, and when a single manufacturer requires 40,000 or 50,000 cases a week of the size of a tea chest, it surely would be worth the while of Indian planters to import either the "Venesta" packages or wood cut in proper shooks from other countries, in places where the native labour and the appliances are so defficient as they appear to be in a vast number of cases The planters also go far to necessitate rebulking in this country by the excessive subdivision of their Teas into different sized leaves. This can only be effected by a costly system of sifting, in addition to the exposure of the Tea to friction, which breaks a large portion of the leaves, and turns them into comparatively waste dust or broken leaf. We have long held that the planters would do far better to buy a reasonable-sized grocers' bulking and cutting machine, and then make much larger breaks of an average quality. The cost would be less, and, we believe in the long run, the relative price would be higher

INCREASING PRODUCTION, LOWER PRICES, AND THE ARTIFICIAL RUPEE.

The production in India, Ceylon and Java, is consequently increasing, for the fresh plantings are year by year coming into bearing. Even if another Tea plant were not planted for the next five years, the increase would still continue from previous sowings. The consumption of Tea in this country has reached its limit, s the next great consuming country—the United States—uses o something like one-sixth of what we use, and is at present grea wedded to the flavoury China Teas. The same is the case Russia, and, although we hope and believe, that Indian and Cey Teas will really make their way in both these countries, demand cannot be important for years; its progress is not qui and the increasing supplies must therefore continue to deluge t market. The action of the Indian Government in artificially fixi the exchange value of the rupee at the rate of 1s. 4d, when intrinsic value of the coin is something about 11d. is also m injurious to the Indian Tea planters. In these depressing time must to a large extent tend to ruin our own growers, or to div the trade to the common Tea of China, because China, owing to unrestricted exchange for the dollar, enjoys an advantage of 2d every pound of Tea. While the possibilities of economies in trade are great, we fear that the possibilities of decreasing pri are even greater, so that the question should be actively taken hand. It is, therefore, obviously to the interest of the whole tr to take up Tea reform in earnest It is possible that the result the coming depression will be the extension of something like Central Factory system. If so, the small gardens would cease manufacture Tea, and would sell the green leaf to the larg operators, who can work better and more economically than small growers. This is the system which long usage has est lished in China, and it is already beginning in India. These lat changes, however, are matters for the future, and the pres necessity is for a simplification and modernisation of the Tea tra such as will greatly reduce the present unnecessarily high cost distribution.

CONCLUSION.

In the above remarks we have given a short outline of the m changes required whether at home or abroad, for it matters lit which section of the trade is benefited so long as expenses can lessened. The necessity for reform must come home very forci to the producer, in consequence of the present great depression values. It is true that, for temporary reasons, very common T have recently very considerably advanced, but we do not thi that this can possibly last for long with the supplies coming f ward. If it do so, and the price of common Indian Tea is ma tained, we shall shortly be swamped with common China Cong which will bring prices once more down to a lower level. If th is no hope for a rise in the price of Tea, but rather a strong prosp of a further fall in it, the only way to save the planters from r is economy in production and distribution. The mixture of two branches of the trade in the above remarks is apparent and real, for we hold that the whole Tea trade is organised far expensively, for the present scale of prices, and that economies cost in any direction will benefit all sections alike.

DISTRICT ASSOCIATIONS.

SHEVAROY.

PROCEEDINGS OF A MEETING of the Committee of the Shevaroy Pla ers' Association held in the Victoria Rooms, Yercaud, at 1 p. m., Monday, the 6th November, 1899. PRESENT:—Messrs. W. J. Lech Thurston Short, Rev. M. Anderson, Messrs. C. Rahm, C. G. Lech S. B. Nicholson, Rev. J. M. Kempf, and Mr. R. Gompertz (*Chairm and Honorary Secretary*).

1. Notice calling the meeting was taken as read.

2. Read circular 89/99 from the Secretary, U. P. A. S. I., *re* exhil ing and selling Indian Coffee at the Paris Exhibition, and enquir what our Association is prepared to contribute towards the expense

Resolved, that the Secretary, U. P. A. S. I., be informed that t Association is prepared to subscribe Rs.200 towards the expenses advertising and dispensing Indian Coffee at the Paris Exhibition, p vided that other Associations will subscribe in proportion

3. *Read* letter from Mr. Leeming returning £4-8-0 from the s sent home to him to purchase books.

Resolved, that the best thanks of the Association be conveyed Mr. Leeming for the trouble he has taken and for the excellent sel tion he has made of books likely to be useful to members.

4. *Read* letter No. 6426 of 30th ultimo, from the Surgeon-Gene of Madras, saying that Assistant Surgeon Pope was not likely to

moved from Yercaud, except under great emergency, and suggesting that the President of the Local Board should be addressed with a view to obtaining, in addition, the services of a hospital assistant and compounder.

Resolved, that this letter should be discussed at the next meeting.

Read and *Recorded* the following letter:—

73/U. W. Circular from the Secretary, U. P. A. S. I., forwarding copy of a letter from the Vice-Chairman of the U. P. A. S. I., urging that Government should be requested to grant some assistance to Coffee at the Paris Exhibition, as it has acted so liberally with regard to Tea.

74/U. W. Letter from Dr. Geo. Watt regarding his method of travelling during his tour through the Wynaad Coffee District.

76/U. W. Circular from the Secretary, U. P. A. S. I., forwarding copies of letters from the Secretary, London Chamber of Commerce, regarding the "*Adulteration of Coffee*"

78/U. W Circular from the Secretary, U. P. A. S. I., forwarding letter from Mr. Ralph Tatham of Tellicherry, regarding "*The Improvement of Coffee.*"

79/U. W. Circular from the Secretary, U. P. A. S. I., forwarding letter from the Secretary of the Indian Tea Association, regarding "*Tea Statistics.*"

9/B Letter from Rev. Father Bruyere resigning the S. P. A., but stating that his successor will join in his stead.

80/U. W. Circular from the Secretary, U. P. A. S. I, forwarding for the information of the S. P. A. an extract from "*Dr. Watt's Tour.*"

The following papers were laid on the table:—

Planting Opinion (4 copies), dated 7th, 14th, 21st and 28th October 1899.

Produce World (2 copies), dated 4th August and 1st September 1899.

Agricultural Ledger No. 8 (Oxon).

Supplementary Report on some "corundum" localities in the Salem District (2 copies).

Proceedings of the Nelliampathy Planters' Association.

Do. Travancore do.

YERCAUD, *7th November*, 1899. } (Signed) R. GOMPERTZ, *Chairman and Honorary Secretary.*

INDIAN TEA ASSOCIATION.

ABSTRACT OF PROCEEDINGS OF A MEETING of the General Committee, Calcutta, 31st October 1899.

Letters of 22nd and 29th September and 6th and 13th October, from Mr. Ernest Tye, Secretary, Indian Tea Association, London, were brought up, after previous circulation, for final consideration. The principal matters to which Mr. Tye referred in these letters were:—

(*a*) *Bonded Warehouse charges in London.*—With his letter of 22nd September, Mr. Tye enclosed copy of a letter, dated 21st September, addressed by the London Committee, to the Tea Clearing House Committee, in reference to this question. In this letter the London Committee laid stress on the onerous nature of the charges levied upon teas by the Warehouse Proprietors, and strongly urged that substantial reductions should be made. In his letters of 6th and 13th October, Mr. Tye referred at length to the General Committee's letter No. 561-O. of 13th September, in which the whole question of the warehouse charges was fully discussed. He stated that a Special Sub-Committee of the London Branch of the Association had been appointed for the purpose of negotiating with the Tea Clearing House Committee with a view to a reduction of charges. The London Committee had also considered the question of the organization of opposition warehouses on the principle of co-operation. It was pointed out that this principle had been adopted for some years by several of the largest London Tea Companies, who had subscribed capital for the purchase of Butler's wharf. Other warehouses might be established on the same principle; and possibly a license might be granted by the Customs' Authorities if the combination were sufficiently strong to guarantee, say, two hundred, or two hundred and fifty thousand chests. If the warehouse were not in a position to offer the facilities provided by the Tea Clearing House, there would be a difficulty with the tea trade; but this might be met by either purchasing or hiring one of the existing Bonded Warehouses. If, in raising the requisite capital, the amount subscribed by each shareholder was approximately in proportion to the quantity of tea sent by him to the warehouse, the rates could be fixed on any scale, because it would be the same thing to the shareholders whether they received the benefit of their co-operative working in the shape of low charges, or as a return in the shape of profits. Companies selling their teas in Calcutta would, however, be unable to control the warehousing of their produce on arrival in London. Precautions similar to those taken on boardship to prevent contact with other produce have to be taken in the warehouses. This necessitates separate buildings; consequently a warehouse which could depend upon a full supply of tea would be at a considerable advantage compared with one which could only utilise a portion of its tea space and could get no return from the balance. For this reason the London Committee believed that some of the existing warehouses had difficulty in working to a profit.

The question was considered by the Committee and the Secretary was directed to address the London Committee again in regard to it, urging them to bring matters to a definite issue. In this letter attention was to be drawn to the suggestion made in the General Committee's letter of 13th September that a scheme for establishing co-operative warehouses should be formulated in London, an enquiry was to be made as to whether it was proposed to devise such a scheme, and it was to be recommended that this should be done.

The Secretary was also directed to write (in continuation of his letter No 569-O. of 14th September) to the twenty-six Calcutta Tea Companies named in the proceedings of the meeting held on 5th September. In this lettter the remarks made in the letters from the London Committee were to be incorporated, and it was also to be stated that they were again being addressed on the subject in further reference to the establishment of co-operative warehouses.

Considered letter No. 4491-T., of 27th October, from the Director General of Telegraphs, in reply to the Committee's letter No. 611-O., of 10th idem, in regard to telegraphic news for the mofussil. With the last named letter, the Committee forwarded a letter of 2nd October, from Mr. J. Buckingham, C.I.E., the chairman of the Assam Branch, suggesting the establishment of a regular system of wiring the latest telegraphic news to Assam. Mr. Buckingham estimated that at least 40 stations in the Assam Valley alone would be only too glad to avail themselves of the opportunity of getting the latest telegraphic communication provided they had not to pay deferred rates. He proposed that for all telegrams conveying English or Indian news, "press" rates only should be charged This proposal was supported by the Committee in their covering letter.

In his reply the Director-General of Telegraphs stated that he was not empowered to grant the concession asked for. He, however, drew attention to rule 109 and footnote, Section II. of the Telegraph Guide. He pointed out that under that rule if in any district served by a telegraph office, whether by hand or postal delivery, four subscribers combined, and desired each to be provided with a copy of a private telegram containing a summary of news, the cost to each subscriber would be practically the same as that of a telegram addressed to each subscriber at press rates. If more than four subscribers desired copies, the cost to each would be less than press rates. Such telegrams would have to be drawn up and sent by an agent independent of the Telegraph Department.

The Secretary was instructed to forward a copy of this letter to Mr. Buckingham with a request for his opinion upon the proposal referred to by the Director-General of Telegraphs and asking whether the Committee could do anything more in the matter.

MARKET REPORT.

[*Per Mail Advices of 27th October* 1899.]

COFFEE.

The London Commercial Record says:—The improved demand reported last week has been maintained, the market closing with a firm tone Larger supplies of East India have been offered than for some time past, and with a good general competition nearly all was disposed of at full to rather higher rates, notwithstanding that the bulk consisted of faded qualities Nyasaland sold in holders' favor. Other descriptions have also been in demand at prices in favor of sellers, Guatemala appreciating 1s per cwt. A large

business has been transacted in "futures" at fluctuating rates, and at the close December Santos shews a decline of 1s per cwt for the week *viz.*:—

London ...	Santos ...	December delivery ...	28s. 9d
New York ...	No. 7 Rio...	„ „ ...	5·10 cents.
Hamburg ..	... Santos ..	„ „	29½ pf.
Havre ...	... Santos ...	„ „	... 35 francs.
Holland ...	... Good ordinary Java ...	...	... 29 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

Export an increase of...	1,620
Stock an increase of	... 2,369

Auctions this week have passed off as follows:—

CEYLON.—*Plantation.*—Of 14 casks 1 barrel offered only 1 lot bold blue sold at 89s.

EAST INDIA.—4,354 bags partly sold as under: *Coorg*, smalls 33s 6d to 41s, low middling to middling 41s to 51s, foxy to fair colory bold 51s to 64s, good blue bold 74s to 80s, pea-berry 54s to 87s; *Mysore*, smalls 33s to 39s. low middling to middling 38s 6d to 49s 6d, bold 50s to 62s 6d, pea-berry 44s to 66s 6d; *Naidoobatum*. smalls 37s, low middling 42s to 44s 6d bold 47s 6d to 50s, pea-berry 49s; *Neilgherry*, smalls 38s, common bold greenish 40s, pea-berry 50s; *Nilliampathy*. low middling brownish 41s to 41s 6d, pea-berry 57s; *Wynaad*, common bold 48s, fair colory 54s to 65s, bea-berry 52s 6d.

MOCHA.—23 half-bales withdrawn.

NYASALAND.—56 bags sold—smalls 36s, middling 45s 6d, bold 58s 6d, pea-berry 56s.

AFRICAN.—*Liberian.*—16 bags good bold bright yellow sold at 33s.

JAMAICA.—16 barrels sold—fine fine ordinary greenish 39s.

COSTA RICA.—Of 701 bags offered 270 bags sold ordinary to good ordinary greenish 31s to 37. fine fine ordinary to low middling 39s to 46s, middling grayish 52s 6d, pea-berry 32s 6d to 49s 6d.

GUATEMALA.—1,215 bags sold—smalls 24s 6d to 37s. low middling 41s 6d to 43s 6d, middling 48s, good middling 50s to 51s, good bold blue 68s to 70s, pea-berry 46s to 68s.

NICARAGUA.—280 bags sold, fine ordinary to low middling 38s 6d to 41s, pea-berry 43s to 46s.

SALVADOR.—1,035 bags sold—good to fine ordinary 35s 6d to 38s 6d fine fine ordinary 39s to 39s 6d, low middling to middling 41s to 44s 6d, bold 48s 6d to 52s 6d, pea-berry 33s 6d to 35s 6d.

MEXICAN.—263 bags partly sold—smalls 30s.

COLOMBIAN.—1,952 bags mostly sold—smalls 28s to 41s, good ordinary dull pale 34s, low middling to middling 42s to 48s, good middling 49s to 57s 6d, fair to good bold 59s 6d to 75s 6d, fine to extra fine 81s 6d to 95s 6d, pea-berry 46s 6d to 69s 6d.

TEA.

CHINA.—A steady trade at recent values is experienced. At auction 3,126 packages have been offered and mostly sold as follows:—Old season's: Formoso Oolong 6½d to 6¾d; new season's: Moning 6½d to 7d, Pekoe Congou 6¾d, Lapseng Souchong 6½d to 6¾d, Penyong 6¾d, Foochow Scented Orange Pekoe 9¼d, Scented Caper 6½d to 7d per lb. Green Tea:—Gunpowder 8¼d to 1s 1d, Imperial 3⅝d to 7½d, Foong Mee 10d to 1s 0¼d, Hyson 3⅝d to 6¾d, Young Hyson 4½d to 5d per lb.

INDIAN.—The quantity offered was slightly under that of the previous week, totalling 46,200 packages *versus* 48,300 packages, while for the corresponding period of last year the amount was much heavier, *viz.*, 53,400 packages.

An improved tone apparent for desirable liquoring teas of most descriptions, which as a rule sold fully up to former rates. For common kinds there was also a brisk demand, very little Pekoe Souchong selling under 6¼d per lb. Medium grades seemed to be in over-supply, as bidding for them was somewhat languid and a large portion (particularly from Calcutta purchases) was withdrawn. Finest tippy parcels continued to be in request, and some high figures were paid for them. Among the results for the best invoices were, Assam:—Budla Beta Estate, BBTCo., 145 packages, 1s 2d; Hattialli Estate, J(A)TCo., 137 packages, 1s 1¼d; Nahor Toli Estate, AADTTCo., 87 packages, 1s 0¾d; Pabbojan Co., 116 packages, and Hokungoorie Estate, AFTCo., 149 packages, 11¾d; Powai Estate, OT&LCo., 117 packages, 11¼d per lb. Darjeeling:—Risheehot Estate, 52 packages, 1s 3¼d; Poobong Estate, 151 packages, 1s 2¾d; Monteviot Esate, 44 packages, 1s 2¼d; Balasun Estate, DCTCo., 100 packages, 1s 0¼d; Cedars Estate, 70 packages. 1s; Gopaldhara Estate, 90 packages, 11½d per lb.

For 36,300 packages on estate account 8⅜d per lb. was obtained, contrasted with 8⅜d per lb. for 37,500 packages, and 9⅛d per lb. for 34,500 packages in the two preceding seasons respectively.

Total printed for the month (including what is declared for Monday, 30th instant):—

1899.	1898.	1897.
230,300 pkgs.	238,600 pkgs.	187,300 pkgs.

making in all 572,000 packages, or, say, 50 million lbs. of the crop disposed of, being almost identically the same as to the end of October a year ago.

Telegrams from Calcutta state that at the auction held there on Tuesday 24,000 packages passed easier, except for common, which was firm. Broken Pekoes declined ½d per lb., and good Pekoes ¼d to ½d per lb.

CEYLON.—Rather less was brought forward, the sales aggregating 21,900 packages, against 25,200 packages in the week before, and 20,000 packages at this time in 1898. Prices ruled on the parity of recent quotations for nearly all sorts, common and finest being especially enquired for. Medium, both Leafy and Broken, were not so much sought after and occasionally went in favour of buyers. Choicest Broken Orange Pekoes again received attention, the following being noticeable:—Talawakelle, 1s 8½d; Ingestre, 1s 6¼d; Troup, 1s 5d; Cranley and Venture, 1s 4¼d; Yoxford, 1s 3½d; Lippakelle, 1s 3¼d per lb.

The average is the same as the 19th instant, *viz.*, 8d per lb. At this date in 1898 it was 8½d per lb.

JAVA.—A varied selection from some of the favourite gardens, comprising a little over 2,000 packages, were included in the catalogues and met with spirited competition, the tendency on the whole being dearer. At present nothing further is advertised.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

	Lbs.
From 1st to 24th Oct., 1899	16,208,091
Do. do. 1898	14,580,124

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	39,862	6,363	46,225
Ceylon ...	20,317	1,534	21,851
Java	1,865	151	2,016
Total ...	62,044	8,048	70,092

Also 751 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated October 27th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1899-1900	605,327	488,582	25,811
1898-1899	584,745	507,172	19,783

47,152 *pkgs.* INDIAN
22,446 „ CEYLON
2,054 „ JAVA
} Total 71,652 packages were offered in public auction this week.

Duty payments for the first four months of the season would, at first sight, appear to indicate a falling off in the use of Indian Tea and a gain in that of Ceylon, but if figures are taken from 1st January to 30th September it is seen that a gain has taken place in the use of both descriptions, the fluctations in duty payments being merely due to temporary influences. Clearances during October have been exceptionally heavy.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to end of September.

	1899.	1898.	1897.	1896.

INDIAN.—Very little change has taken place in the market. Although Monday's auction passed off somewhat slowly the tone improved during later sales, and at the close of the week bidding was slightly more animated. The following averages are worthy of note:—"Risheehot," 1/3¼; "Poobong," 1/2¾; "Monteviot," 1/2¼; "Budla Beta" and "Oaklands," 1/1¾.

Week's av. of Tea sold on Garden Account 1899, 36,773 pkgs., av. 8·34d. 1898, 40,392 pkgs., av. 8·25d.

Total Tea sold on Garden Account 1st June to date 1899, 426,038 pkgs., av. 8·54d. 1898, 407,456 pkgs., av. 8·71d. Comparative prices of Indian Tea in London.

CEYLON.—This week's sale was the smallest that has been held since early in August. The Gradually-reduced offerings have had a beneficial effect resulting in improved competition and slightly firmer prices for all descriptions.

Average for week 8·02d., against 8·50d. in 1898.

Ceylon Tea sold on Garden Account 1st January to date 1899, 888,215 pkgs., av. 7·96d. 1898, 939,175 pkgs., av. 7·69d.

JAVA.—2,054 packages were brought forward comprising selections from 14 gardens; demand on the whole was good, the Teas selling fully up to recent prices. 108 pkgs. from "Goalpara" avg. 9¾d.

IN SYDNEY.

The tea markets have made another step in importers' favor, and the week's (ending October 21) business distinctly shows an advance in Indians, while holders of Ceylon and Chinas have maintained a firmer front. High prices have been productive of increased difficulty in doing business, but for teas with quality at moderate prices, there has been a better disposition shown by buyers to operate. Despite the excited tone of the markets of the East, buyers have not seemed inclined to take advantage of recent low

quotations for local stocks, and not until the arrival of later shipments showing an increase of something like ten per cent. on values of a month ago, has the trade been aroused to a sense of the actual high coast of the small supplies coming to hand.—*Sydney D. Telegraph*, Oct. 23.

COCOA.

A rather better tone is manifested, and of the fair supply of 5,191 bags offered at auction on Tuesday last 2,450 bags sold, at here and there some slight advance. 641 bags Trinidad practically all found buyers at 71s to 76s 6d for middling to fine red, or 1s to 2s over valuations. Of 334 bags Grenada 240 bags were placed at 63s to 65s for full rates. 17 bags fair Jamaica brought 62s to 63s. Of 50 bags Surinam 20 bags fine realised 66s. Guayaquil met a good demand, but at barely anticipations as regards prices; 2,238 bags were catalogued and rather more than half sold at 67s to 71s 6d for ordinary to good Arriba, 67s for Tenguel, and 63s to 67s for gray to fine red Caraquez. 103 bags Colombian, 81 bags Samana, and 270 bags Carupano retired unsold. Of 109 bags African 30 bags found buyers at 61s for bold grayish red. Ceylon, of the quality chiefly offering now, does not attract bids, and these are generally pitched in a rather lower key than of late; 1,328 bags brought forward and 280 bags sold bold dullish red 74s. middling ditto 70s, good small red 70s, dull 66s, and common Native 58s to 59s per cwt. Privately 850 bags fine African have been sold at 63s to 63s 6d, good at 61s to 62s; also 500 bags Guayaquil—Caraquez at 64s to 65s, 400 bags Trinidad at auction rates, 150 bags Grenada at 66s for fine, 1 0 bags Samana at 58s to 58s, and 100 bags Bahia at 61s per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

BLACK.—The market is very firm, and prices are dearer in all positions. A considerable business has been done, including 250 to 300 tons Singapore—at 5⅝d to 5¾d on the spot, at 5¾d near at hand, at 5 13/16d October-December shipment, at 5 31/32d January-March, and at 6d February-April. Some Tellicherry sold on the spot at 5 11/16d, and fair Aleppi at 5 9/16d to 5⅝d.

At public sale on Wednesday 100 bags Penang bought in at 5⅜d, 5½d bid. 16 bags Ceylon partly sold at 5⅝d per lb. for good heavy. Of 778 bags dust and shells 147 bags sold at 2¼d, two lots 1 7/8d to 1¾d per lb

WHITE.—Is firm, but quiet About 100 tons have been sold, viz., fair Singapore on the spot at 8 1/16d to 8¾d, near at hand at 8 September-November shipment at 8¾d, and January-March at Siam near at hand at 8 1/16d, and Penang October-December at 8 and January-March at 8 1/16d.

At auction on the 25th instant, 20 bags fair Ceylon sold at 8 and 8¼d per lb. was taken for an odd lot of 3 bags Penang.

GINGER.

COCHIN.—Sincere belief here in the report of a poor crop gi great firmness to Ginger, and prices have improved a little both spot and for forward delivery. In the former position about 2, bags of medium and small washed rough have been sold at 26s 26s 6d, mouldy and wormy ditto at 23s to 24s, and brown pickin 22s 6d; Calicut rough Sorts 27s, wormy ditto 26s, small ditto 20s also 100 tons washed for February delivery have been done at and March at 28s 6d. Cut kinds are very strong, as if the cro poor it stands to reason that the quality will be unfit for cutti Auctions offered 98 cases 1,656 bags, 15 cases 289 bags selling very full rates—good medium and bold roughly cut and scra limed 76s, very bold but very roughly cut, heavily limed 73s mouldy ditto 70s, fair medium and small washed rough 25s, mou and wormy ditto 23s 6d to 24s 6d, medium and small brown rough 24s 6d, small lean and wormy rough, mixed shrivelled 21s per cwt.

JAMAICA.—Quiet, but steady. 76 barrels. &c., offered, but on barrels sold—dull 55s, Rhatoon 48s per cwt.

CINCHONA.

The average percentage of sulphate of quinine in the bark t offered at Amsterdam on November 2, is 5·32 per cent. aga 5·25 per cent. in the September auctions, 5·60 per cent. Aug and 5·21 per cent. for the ten auctions of 1898. The 6,141 packa to be offered contain 561,330 kilos. of Java bark, with a tota 26,850 kilos. (939,750 oz.). The only offering in auction was a pa of 6 bales red bark, dull broken quill, for which 4¾d. was refuse

QUININE.

There has been an absence of excitement this week, although second-hand market is fractionally higher than when we closed last report. In second hands very little business has been don to Wednesday, and on that day December delivery was quote 1s. 1¾d, and March at 1s. 2d per oz., with few sellers. To-d business is in December 1s. 1¼d. and March 1s. 1½d. There is likely to be any development until after the Amsterdam sales week.

In regard to the fire which occurred in the Bandong Quin factory last month. and to which we have previously referred now learn that the samples for sale on January 31, 190 0, had l sent out to Batavia, Samarang. and Sourabaya, and there is a s of about a ton of sulphate of quinine on hand; but the sale is li to be delayed for a month. Owing to the increase of the busi and the want of working capital the company have just ma further issue of shares to the amount of about 4,000*l*.

(AVERAGE FOR ALL INDIA 8·69d.) October 27th.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 1st proximo. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 21*st November.*—*Weather.*—Bright cold weather continues. Much more East wind this week. *Crops.*—In full picking nearly everywhere. *Plant-diseases.*—Leaf-disease has mostly passed off. Trees are looking splendid, carrying a profusion of healthy foliage, and appearances everywhere point to a bumper season next year. *Labour.*—Continues plentiful. *General Health.*—The sudden change in the weather has given rise to colds, coughs and fever. *Interesting Item.*—Don't know whether it is quite so; but shower of Leonids was a disappointment in these parts.

LAND AND AGRICULTURAL BANKS.

In 1892 Mr. J. A. Nicholson was placed "on special duty for the purpose of enquiring into the possibility of introducing into this Presidency a system of agricultural or other land banks." After most laborious and painstaking investigations he published a voluminous report and "studies" on the subject. These were duly reviewed by the Board of Revenue, and now the Government has passed orders. Unfortunately, the report is far too lengthy to be reprinted by us in full, even the Board's review would occupy more space than we are prepared to give it, and the Government Order, while it summarises the report and touches upon the review in such manner as to convey a very fair idea of the trend of both, also runs to great length. The subject is one that should have a very special interest for our readers, as they are numbered among the ranks of agriculturists. It was not with them particularly that Mr. Nicholson was called upon to deal, but every recommendation he made, and every decision arrived at by Government after consideration of his recommendations, might be applied as much to the so-called planting industry "as to that which is more generally understood as embraced under the term 'agriculture.'" Though Government appears to favour village banks, or institutions to

assist the villager, the planter of coffee and the cultivator of paddy may, for all practical purposes, be regarded as capable of bringing themselves equally within the scope of any special arrangements that may be eventually made for the improvement of the economic position of agriculture in the Madras Presidency. It will depend upon the planter, rather than upon the Government, whether the former does or does not bring himself within the sphere to be affected by any such arrangement.

Both the Board and the Government point out contradictory sentences in Mr. NICHOLSON'S report, though both do full justice to the fact that such contradictions are but natural where a vast and extremely intricate subject is considered. The Board's review is more adverse than the Government's Order. It gives an abstract of Mr. NICHOLSON'S views as follows :— After making a bulky survey of the treatment which the question of the relief of agricultural indebtedness has received in Europe and in America, Mr. NICHOLSON declares that State banks are out of the question ; that for the several classes of rural borrowers it is not land banks or great institutions that are required, but small local societies corresponding to the popular banks and credit associations of Germany, Austria and Italy, and to the building societies of England and the United States ; and that small societies giving small credit to small folk are the desiderata for Madras. He cites the existence in this Presidency of some hundred and forty Friendly Societies or *Nidhis*, which have their nucleus in those Building Societies, as presenting a prospect of the successful solution of the problem, although he is not oblivious of their defects. He advocates, therefore, the inauguration of a huge system of village banks on the co-operative system, and on the basis of self-help, under the supervision of Government, carried out by a Commissioner of Rural Credit. It is not quite clear whether he originally proposed to do altogether without State aid. In the various passages in which the point is referred to, there is some want of desirable clearness and consistency. There are signs here of mutations of opinion, which were to be expected from protracted and intermittent study, and are natural in a lengthy compilation, which has been under preparation during several years. But, on the principle that supervision connotes the grant of privileges, he eventually provides for " fiscal, legal and executive privileges," as well as for State subventions. The boon to be provided is, the reduction of the current rate of interest by one-half. This object is to be obtained, first, by the elimination of working expenses. All service is to be rendered gratuitously. In the second place, the borrower and the lender, as individuals, are to disappear. Credit and capital are both to be pooled, in so far as the members of the Co-operative Society are concerned. Business with the outside is, however, contemplated ; the capital for this department of the operations, as well as, to a certain extent, for transactions in the Co-operative branch, being obtained from the public by means of debentures. He very properly disclaims the task of bringing into existence from the very commencement, a complete system of village banking. He relies on the motto *Solvitur ambulando*. Nor is he blind to the results of suddenly introducing a system of cheap credit amongst a people, ignorant of the most elementary principles of banking, and amongst the large mass of whom, thrift, prudence and self-restraint are unknown. Mr. NICHOLSON is therefore hopeless of success within any period which can be described as the near future. He commits the fate of what he terms " educative credit " to labours of villagers of " apostolic fervour " who will be e tent and proud to toil in person, without fee or reward, the regeneration of those around them, as Schulze-Delitz Raiffeisen, Luzzatti and Wollemborg did in Austria, G many and Italy.

Government's view is amply shown in G. O., No. 7 Revenue, dated 13th October 1899, and is in favour a trial being made within somewhat narrow limits. NICHOLSON will doubtless give effect to this order. Agric tural Banks are under trial in Mysore. Something deserv a similar title will now perhaps be tried in this Presiden and though there are likely to be many differences in reg to points of detail, the Presidency may certainly learn a g deal from the experiences of the Province. In so far the scheme will affect rural cultivators, we confess to gr doubts as to its efficacy or utility. The plan is admirab the machinery for carrying it into execution is cumberso and is bound to prove faulty. Practice will be fou to falsify theory, for the one will unquestionally be perva with dishonesty, and will depart from the high ideal of other. Government has already attempted much in beh of the ryot ; in the light of what has actually occurred, judge that its attempts have largely resulted in failur here complete, there partial. The same thing will oc again. If planters can be induced to give the new sch a trial, if they will endeavour to avail themselves of the h of the State to raise the financial assistance that so many them require to tide them over a season of grave depress then the scheme will have a trial under the most favour auspices possible, for the possibility of dishonest applica of rules and principles will be reduced to a minimum. the planter, there is hope in the scheme ; for the agric turist, we fear, but too little. This is our view of the matt but whatever initiative Government officials may take, almost certainly aim at benefitting the agriculturist ra than the planter. Unless, therefore, the latter moves in own behalf, the planting industry will, in all probabil be regarded as a thing apart. It is obviously Governme aim to form *village* co-operative banks alone.

DISORDINATE VARIATIONS IN HYBRIDS.

Mr. C. Naudin gave in the *Revue Horticole* some ago the conclusions he has arrived at after a long experi with hybrids between a considerable number of specie plants. The conclusions are in part as follows :—The n nearly congeneric species resemble each other, the n certain and easy is their hybridization. The resemblan however, are physiological and do not always appea external characters. Certain plants, which are very diff in general appearance, cross very readily and produce fe hybrids. This is the case with *Linaria vulgaris*, a p having large yellow flowers, and *L. purpurea*, which small dark-purple flowers. This is also true of *Nicot tabacum* and *N. glauca ;* the first an annual, with large l and pink flowers, and the second a small tree, with comp tively small leaves and small yellow flowers. That ext resemblances are not a sure indication of physiolo affinities is well shown in the case of squashes. *Cucu maxima, C. pepo, and C. moschata*, in spite of their resemblances in habit, foliage, and flowers, do not hybri while *C. melonosperma*, though very different from the

species of the genus, is influenced by their pollen and produces fruits which, however, contains seeds with imperfect embryos. Either from imperfections of the ovules, or more frequently of the pollen, or of both these, hybrids are often sterile ; but, as a compensation for this inferiority, they are often large and apparently more vigorous than the parent species. The sterility of hybrids is far from general. A considerable number of them are in some degree fertile to their own pollen, and more certainly so to the pollen of one or other of the parent species. Moreover, some are as fertile with themselves as are the parent species. External resemblances of the species do not warrant a conjecture as to the degree of fertility of their hybrids.

There is some truth in statements commonly made that hybrids soon revert to the specific types from which they came, or become extinct on account of the increasing imperfection of their reproductive organs ; but the exceptions are numerous. In experiments in hybridization, the successive generations were watched for many years. In the first generation, that which results directly from hybridization, the products is in general very uniform, the dissimilarity of the individuals not being very marked. The majority are intermediate between the two parent species, some inclining more than others toward one of the two species. In the second generation, the case is wholly different, the rule being dissimilarity. Among 100 individuals, possibly a dozen approach more or less to the parent species without reverting entirely. The remainder are an aggregation of anomalous forms, no two of which are alike. This capriciousness resulting from hybridization, the author terms disordinate variation (*variation desordonnée*).

INDIAN TEA AND COFFEE.

We publish to-day some very interesting comments from Canada, the United States and France. All are more or less encouraging. The *Canadian Grocer*, treating of Tea alone, says that, though Indian and Ceylon tea average 4c (say, 2*d*.) per lb. more than the Japan leaf, the flavour of the former evidently pleases the popular palate. As, moreover, the Indian "is heavier, with more in it for less money, than the China black, it is ousting both the latter and Japan from the Canadian market." Well-informed men in the trade are of opinion that the importation of Indians and Ceylons into Canada during 1899 will show an improvement over that of 1898. As regards the United States, the *American Grocer* points out that legislative measures have excluded very low priced Chinas, so that in regard to price these are now on about a level with Indians and Ceylons, "and, at the same price, the more desirable for blending or any purpose is the machine-made tea of Ceylon and India." Our contemporary alludes to the consumption of these as *increasing*. In France, an improvement of quality and a reduction of cost are sadly needed. With an earnest effort on the part of the Associations interested, this should be easily brought about, especially with the Paris Exhibition to serve as a base of operations.

To all who are in doubt as to the desirability of taking every possible advantage of the opportunity this Exhibition will afford with respect to Indian Coffee, we would specially commend the remarks on "Tea and Coffee in Paris" that are quoted to-day from the *Grocer*. There is a great deal conveyed in very few words. It remains for planters to avail themselves of the hints given.

THE SAN JOSÉ SCALE.

There appears to be room for hope in regard to the insect pests that afflict plant life in India. What has been done with reference to the San José scale pest in California affords an indication of what can be effected. It is but a couple of years since fears were entertained that the San José terror would overrun the United States. Restrictive legislation was talked of as a preventive of ruin to orchards. A draft Bill was actually prepared ; but, in the meantime, scientists set to work to try to stamp out the pest, cultivators were exhorted to be vigilant, cheering reminders were circulated that the San José scale was not a new creation, and that, as it had been kept in check in the past, it was but reasonable to hope that pessimistic prophecies would be falsified. To judge from the latest reports, it is now no worse than other pests, and has ceased to cause any special uneasiness. The basis of one series of precautions adopted in the State of New Jersey was —be it said—the following resolution of the State Board of Agriculture :—

That this Board request of the Legislature the appropriation of the sum of one thousand (1,000) dollars, to be expended under the direction of the Director of the State Experiment Station for the purpose of studying the habits of the San José scale, its natural parasites and enemies, and the best methods of exterminating the same.

Also for the purpose of importing into the State of New Jersey such natural enemies and parasites from other States or countries as may offer a chance of lessening or exterminating this most formidable pest. That the appropriation be made available immediately, that effective work may be accomplished during the present year of 1896.

Professor John B. Smith, the State Entomologist, was appointed to carry out the purpose of the resolution, and, after studying the life-history of the pest and the measures adopted in California for its extermination, he found that some 50 or 60 species of "natural enemies" of the scale had been imported from Australia. Of these, the only ones that maintained themselves for even a short time were three species of *Rhizobins*, two species of *Orcus*, and one or two others which were not specifically scale-feeders. Subsequently, the *Orcus* almost died out, and Professor Smith concluded that the Australian insects had nothing to do with keeping the scale in check ! Of indigenous lady-birds, however, he speaks much more appreciatively ; but he expresses a firm belief in artificial measures, such as spraying, and evidently holds it to be useless to plan a line of defence consisting solely of "natural enemies" of the scale.

COFFEE IN DISTANT LANDS.

XII.

Guatemala.—Mr. Consul Trayner reports :—The coffee crops for the financial year ending September 30, 1898, were not so successful as had been hoped, and the reports of the managers of various German companies owning large estates in the country almost all show a deficit. In most cases the reasons assigned for this unsatisfactory state of affairs are the smallness of the crops, the extraordinary fall in prices, and the large outlays required for improved machinery, &c. The reports issued by one or two of these companies may be briefly noticed.

The Plantagen Gesellschaft Concepcion in Hamburg—This company was formed in February 1897. The company has issued for the purchase of estates, &c., a debenture stock

of 1,500,000 marks. Its share capital amounts to 2,000,000 marks, divided into 2,000 shares of 1,000 marks each. The company's business is to cultivate coffee, manufacture sugar, and to breed cattle. Its first business year, ending September 30, 1898, was, on the whole, not to be accounted satisfactory, as the accounts show a deficit of 94,000 marks attributed in the report to low prices. The sugar-cane crop amounted to about 25,000 quintals. The coffee crop yielded about 5,100 quintals; 8,500 new coffee trees have been planted in the place of old trees this year, and since the formation of the company the trees planted number some 27,800, making the total number of coffee trees on the estates about 547,000, many of which will bear fruit next year for the first time. About 264,300 bottles of brandy were distilled up till June 30, 1898, which, notwithstanding the considerably lower prices obtainable, yielded some profit.

The Hanseatische Plantagen Gesellschaft, Guatemala-Hamburg.—This company, founded in 1889, owns the three estates: "Los Diamantes," "Las Vinas," and "El Zapote." The average dividend declared for several years reached 7 per cent., but the year ending September 30, 1898, was most unsatisfactory, the shareholders not only receiving no dividend, but the balance-sheet showing a loss of 22,000 marks. This loss is also attributed to the smaller crops, the lower prices, expense of putting in new machinery, higher wages, &c. The coffee crop yielded 13,507 quintals, the three estates producing the following respective amounts:—

	Quantity. Quintals.
"Las Vinas"	8,425
"Los Diamantes"	2,637
"El Zapote"	2,445
Total ..	13,507

In the case of *the Osuna-Rochela Plantagen Gesellschaft, in Hamburg*, a great falling-off in crops and a large deficit for the year is reported, and the same causes, as in the preceding reports, are given for the shortage. The estates of "San Andres Osuna" and "La Rochela" had a crop of—

Year.	Quantity. Quintals.
In 1895-96..	15,003
1896-97..	22,100
1897-98..	12,300

In the first two years the company paid dividends of 7½ and 5 per cent., respectively, but last year a loss has been suffered amounting to 330,000 marks.

The "Guatemala Plantagen Gesellschaft in Hamburg," whose principal estate in this country is the "Hacienda el Porvenir," reported a very successful year in 1896, owing to an extraordinarily large crop, and paid a dividend of 12½ per cent. The succeeding year this dividend fell off to 10 per cent.; in 1898, notwithstanding the heavy fall in the price of coffee, the books of the company show a profit of 80,000 marks, and a dividend of 4 per cent. was paid. The crop yielded 15,500 quintals.

The "Chocola Plantagen Gesellschaft in Hamburg"—has also to report a small surplus for the year ending September, 1898, and instead of paying a dividend of 20 per cent. as in three previous years, one of only 4 per cent. has been declared. The reasons assigned are again small crops, low coffee and sugar prices, and insufficient demand for cattle, and partly because the working expenses at Chocola could not be covered as in previous years out of the proceeds of the cattle and sugar.

It will thus be seen that in all these representative co plantations the same falling-off of crops and profits has to place, and that in every case the same reasons are assig Whether the price of coffee will again rise in Europ markets is a point on which I am unable to speak, b seems probable, from all accounts, that there will be a siderable improvement in the crops of this in-coming har in Guatemala, and this prospect, together with a repo decrease in the Brazilian crops, makes the coffee-plan sanguine as to the future.

The export of coffee has slightly increased in bulk, but again fallen in value.

The total value of exports for this year is estimate 15,377,460 dol. (silver) equal £1,098,390, as compared 19,775,860 dol. (silver) equal £1,582,068, in 1897. The thus a general decrease of over 4,000,000 dol. (silver).

The amount of coffee exported in 1897 was 824,755 q tals 85 lbs., valued roughly at £1,510,056, while this the amount increased to 826,032 quintals 83 lbs., value £1,004,471, showing a falling-off in value of more £500,000 sterling. This must probably be the result of development of new fields of coffee cultivation in Africa elsewhere. A table is annexed showing the proportion which different countries bought the Guatemalan coffee.

	1898. Quintal.	slbs.	1897 Quintals.
United Kingdom	179 999	13	123.277
Germany	499,270	11½	543.806
United States	128 373	23½	137,055
Other countries	18.390	35	20,616
Total	826,032	83	824,755

NOTES.

The Planters' Association of Ceylon. The General Meeting of this ciation will open at Kandy on day, the 5th proximo.

Mr. Kelway Bamber's Report. Mr. Bamber has handed t "Thirty Committee" a long sy of his report. The report w printed at once and circulated.

Cinchona. The average price per unit Amsterdam sales of 2nd instan 6 8c. = 1⅛d., an advance of about 25% on the figure re at the last previous sale.

Planters and Coolies. For the convenience of our re we give to-day the text of the Bill for the Regulation of Labour on Coffee and Tea P (Madras), which is now under consideration.

The London Coffee Market. Mysore, average (B) size, i quoted 48s. Stock, 17,581 tons night's landings in the United dom, 900 tons; fortnight's deliveries, 2,700 tons.

The Maturing of Shoots—Tea. A correspondent of the P says that we may safely take fifty days is about the time that

matures ready for plucking in the Sibsagar district, Assam, in the early part of the year,—after pruning to the first plucking.

The Paris Exhibition. It is stated that the French Government are spending £4,000,000 on the Exhibition and foreign nations £2,000,000 ; that nothing like it has ever been seen, and that 150 millions of people will visit it.

Coffee. We publish to-day an interesting letter from Messrs. W. H. Crossman & Brother, of New York, and an article from the *Brazilian Review*, both dealing with the prospects of Coffee. Pressure on our space and time compels us to defer comment.

The Poor Cooly. "Producer's" remarks quoted from *Capital* deserve perusal. They point to the Currency Policy of the Government of India as meaning —for the Government, financial equilibrium ; for the planter, ruin ; for the cooly, starvation.

Molta's Brazilian Coffee. In continuation of our recent remarks about this article, we are now able to state that the Coffee is packed in tins retailable at 9-pence, and the edge of the tin cover is overlapped by an air-tight label, so that all the aroma and strength of the coffee is retained.

The London Tea Market. Cabling on 16th instant, Messrs. Gow, Wilson & Stanton reported a steady market for Ceylon teas, medium sorts weak. Fair liquoring Ceylon Pekoe Souchong 7d. ; average 8⅛d. (⅛d. down). According to Reuter, 22,000 packages Ceylons were sold out of 23,000 offered, and 45,000 Indians out of 51,000 offered. The average of Indian was 8⅝d. (⅛d. down).

Calcutta Tea Sales. The average price at the sales held on 10th instant was 6 annas 3 pies. At the auction on 17th instant 23,421 packages were sold. An easier tone prevailed throughout the sale. All common to medium teas were three to four pies lower. Bombay buyers bought freely at the lower rates. A few parcels of Darjeelings fetched full prices. There was good competition all round.

Ceylon Tea at the Paris Exhibition. Mr. J. H. Renton, Ceylon's representative at the Paris Exhibition, invites tenders for the supply of tea to be used in the Ceylon tea-house, at the Exhibition. Orange Pekoe (fine flavoury, high grown) will be required and 5,000 lbs. are to be delivered in France by March, while, 5,000 lbs. more may be required. Particulars of the conditions will be found advertised elsewhere.

Tea at the London Customs. With the approval of the Treasury, the London Customs authorities have decided to issue an order taring to the half-pound, to take effect on the 1st December, the number of tarers being increased. In view of the difference of opinion on the subject, they decline to abrogate their order of 1894 authorising average tares as an alternative to the separate taring of each chest.

Colombo Tea Sales. At the public sales of tea at Colombo on the 15th instant, about 8,314 pkgs. = 675,391 lbs. were offered, of which about 6,000 pkgs. = 482,365 lbs. were sold. The sale passed off with active competition for all leaf teas. Broken pekoes of all grades were somewhat easier. The *Times of Ceylon* states that good invoices were offered from Gonapitia, Hayes, Harrington, Queensland, Monkswood, Middleton, Ireby, Agra Ouvah, and Glassaugh.

Tea-Ette. The following is from the advertisement columns of a leading New York paper :—

Tea-Ette.—Tea-Ette is the greatest discovery of the 19th Century. What is Tea-Ette? It is Tea of the best qualities, with the Tannin modified, *i.e.*, bitterness extracted. Tea irritates the nervous system; while Tea-Ette builds it up. Nothing can equal Tea-Ette in building up the nervous system. Tea-Ette is also a sure cure for Dyspepsia. Physicians recommend it. A fair trial will soon demonstrate these facts. Tea-Ette is better and cheaper than Tea. Why not try it. If your grocer has not got it, tell him to get it. Or send to the Royal Tea-Ette Co., 43 Wallabout Market, Brooklyn, N. Y.

Ahem !.

"Salada" Tea. The Manager for Eastern Canada of the "Salada" Tea Company writes :—This place is in the Province of Quebec, in which province there is a population of one million five hundred thousand souls, 80 per cent. of these being French, who use almost exclusively China and Japan teas. "Salada," our our own specialty, is being pushed on this ground vigorously, and has been very kindly received by the English-speaking portion of the population, and we are gradually—though very gradually—getting some support from the French element.

A good Advertisement. A Colombo contemporary cities, as "an effective tea advertisement" the page in a recent *Canadian Grocer*, devoted to the official Ceylon and Indian advertisement, has a very effective woodcut. The "Columbia" and the "Shamrock" are racing level, with the words "Ceylon" and "India" on their respective pennons ; and away astern are square junks, with lateen sails, and flying the flags of Japan and China. Below appears the following letter-press :—

There's as much difference between the "Shamrock" and "Columbia" and the old-fashioned junk as there is between the delicate well-flavored machine-made Ceylon and Indian Teas and the hand-rolled, lead-colored, Japanese and Chinese article. The comparison is striking. Test the teas and be assured of the statement. Insist on your wholesaler supplying you with Ceylon and Indian Teas.

The Mansion House War Fund. A proprietary planter in Ceylon has suggested contributions from planters on a scale of R.1 per acre, and has paid up his own donation to the fund on that basis, *viz.*, Rs.277. We note that the *Madras Mail* thinks that subscriptions ought to be sent to Messrs. Arbuthnot and Co. as local agents for Messrs. King, King & Co., of Bombay, who have the authority of the Lord Mayor of London to collect moneys. This is an erroneous idea. Any newspaper is as much authorised to open a fund for any public purpose, as is a citizen to send in his subscription to this particular fund directly or indirectly to the Lord Mayor.

Cinchonine Isomers. The *Monatshefte f. Chem.*, xx., 425, says :—By the action of concentrated hydrochloric acid on cinchonine, there are obtained several isomers, of which the chief are pseudocinchonine and *a*-isocin-

chonine. Arlt has taken up the investigation of these bodies, which were originally discovered by Hesse, and claims that he has obtained pseudocinchonine in the pure state, melting at 267° C. In the mother-liquor from the crystallisation of its hydrochloride, he found two bases, which he considers are allocinchonine and δ-cinchonine. A β-isocinchonine is said also to exist, but it appears to us that the evidence of the individuality of these isomers requires to be somewhat strengthened.

Exports of Ceylon Tea. The Ceylon Customs and Shipping returns for the half-year from January to June, with a memorandum on the trade of the island for that period, by the Hon. H. L. Moysey, Principal Collector of Customs, show that in 1899 of Tea there were exported 64,329,419½ lbs. against 65,236,220 lbs. in 1898 the value per lb. in 1899 being 42½ cents against 38½ cents in 1898. Of Cinchona the quantity exported fell from 563,986 lbs. in 1898 to 42,196, in 1899 and of Cacao from 29,454 cwts. to 26,043 cwts. There was an increase in the shipments of Plumbago, the quantity rising from 220,523 cwts. in 1898 to 297,577 cwts. in 1899. There was an increase of 153,440 lbs. in the shipments of Cinnamon, the quantity shipped being 1,909,266 lbs. in 1899 against 1,755,826 lbs. in 1898.

The Labour Question in Brazil. A great many complaints have been heard lately about excessive emigration of labourers from Brazil, and apprehensions have been persistently expressed that a severe want of hands will be felt during this season, which will bring about the abandoning of plantations, and consequently a much smaller yield. A correspondent remarks:—There are rumours that our Italian labourers will go to Venezuela to help coffee-planters there. We are only afraid they will change bad for worse and come back again. To ascertain to a nicety whether these fears are well founded is extremely difficult. It is true that many planters have tried to put the wages for certain work down, and it is most likely that labourers have left them; but whether they will emigrate not to return again is another question.

Coffee in Queensland. The Sydney *Daily Telegraph* lately stated in a leading article that in 1896 Queensland put 138 acres under coffee, and last year this was increased to 432 acres, while in 1899 a further considerable extension has been notified. Queensland is already in a fair way to supply her own market, and with similar duties on imports into Australia she may look forward to supplying a very much larger one. The *Sydney Mail* states that in North Queensland, a proof of the super-excellence of local conditions is seen in the fact that the trees will bear full crops at their fourth year, with no harm to the quality of the coffee or the life of the tree. Mr. Newport is said to have become exceedingly hopeful for the prospects of coffee in Queensland. £50 profit per acre is not looked upon as at all an impossible return after four or five years' work.

Tea and Coffee Taxes. Thus the *Central African Times*:—Owing to the fineness with which the profits on the tea-growing industry are cut, the planters are trying to abolish the trade tax called the one-pound "draft." This is a trade custom which benefits the tea-dealers, but seriously affects the pockets of the producers. A similar tax in the coffee trade could well be done away with; but, un there was an exceptionally strong combination, the prospe of success are not bright. The tea trade are fighting producers hard, and it will be interesting to see on which the victory will rest. If the tea-planters are successful, it pave the way for coffee-planters. In these times of depres prices, every unnecessary tax ought to be removed and in connection we think H. M. Commissioner would be cons ing the best interests of the country if he would abolish wharfage charges on coffee.

Tea in B. C. Africa. A correspondent, writing on 2 ultimo, says that the crop is just ov and is apparently a large one, but whether he alludes to or Coffee is not quite clear. However, he says about tea "I have not had much experience of tea-making. In early days of hand-work, I got some lessons from the A. Cameron when on his rounds and turned out fairly g tea, which sold at 50 cts. per lb. in Colombo. But w puzzles me here is, I sometimes make a break of tea wh is quite better; and if any of your experienced planters your worthy self would tell me what is the cause of be tea I would be much obliged. I see nothing in T. C. Ow book about it, and never remember turning out better te Ceylon. I have an idea that it is the withering or ferment that has to do with the bitterness as it is only occasion it turns out better."

Indian Tea Companies' Results for 1898. Mr. George Seton has issue table showing the results for 189 the 45 leading Indian compan They have a total capital of £7,047,885 and a cultiva acreage of 175,427. The average cost per acre is £40, the crop per mature acre 457 lbs. The cost of produc works out at 7·27d. and the profit per lb. 1·43d. This d not leave a very large margin, but the profit on capit 5·56 per cent., and the average dividend (inclusive of Pre ence Dividend) is 5¾ per cent. The total Reserve is £534, equal to 7·59 per cent. of the capital. The average p per mature acre is £2-14-7, and the average ratio of expe to receipts 84 per cent. Comparing these results with Ce one is struck by the high cost of production; but this is certain extent counterbalanced by the average price obtai 8·70d. per lb. The Reserve Funds are comparatively la all but four companies having an entry of this sort, b would not be fair to compare India and Ceylon in this resp the Ceylon industry being of so much shorter growth.

Hybrid Coffee in B. C. Africa. "H. B." writes from Mlanji to *Ceylon Observer*:—I have freque read in the columns of your *Trop Agriculturist* about hybrid coffee. Why, it is as commo anything here. From some Orange coffee imported by Church of Scotland Mission by Garden or some other son, we have got it hybridised on, I suppose, every esta British Central Africa. At all events Mlanji has got every shade from the real Orange to nearly approaching dark green of our Coffee Arabica. I have often wond whether this variety would resist the attack of leaf-dis I could send some seed to any one in Ceylon who may to try it. From a small-leafed West African coffee we several hybrids. The narrow-leafed coffee that my P.I Dimbula used to point out as a mail (? male) coffee, and

orders to reject when counting the plants, is also here, and has got hybridised with the Arabian variety. I got some Liberian coffee seed from the Blantyre Mission in 1892 and and put it into a nursery, and remember a few of the seeds came up; but what became of the plants I never found out from my assistant who did not know much about coffee. After some years I discovered several of the Maragogipe or hybrid variety of coffee trees in a field of about 140 acres; but how they came there I do not know, for I never got any seed or plants of Maragogipe from anywhere, and can only surmise that a Liberian plant must have existed somewhere and got hybridized with the Arabica.

The Vanilla-crops. Mr. J. S. Simon, of Paris, has issued his annual report on the vanilla-crops for 1898-99, and, as foreseen by him, the returns have been—

	Kilos.
Seychelles	24.500
Madagascar, &c.	13,000
Bourbon	77,500
Total ...	115,000

In 1897-98 the crops amounted to 180,000 kilos. (including 125,000 from Bourbon), so that there has been a shortage of 6,500 kilos. As to the 1899-1900 crop, competent judges are not agreed, and it is difficult to say anything with regard to Bourbon before the end of the year. The persistent drought of last year has had a bad effect upon the vanilla-plantations, and the cyclone in March has much modified the expected production after the dropping and death of the trees. Some planters say that the production will not exceed that of last year; others foresee a crop of from 90,000 to 110,000 kilos., but an average figure would be 100,000 kilos. The Seychelles Islands are estimated to produce 5,000 kilos. less than last year. On the other hand, Comores is expected to yield a better return. In admitting 100,000 kilos. from Bourbon, there will be an increase of only 2,000 kilos. on the total production. In Mexico the crop has been good, but quality is not satisfactory. In Europe, Mexican beans are of little account, first quality being quoted from 150f. to 200f. per kilo., according to quality. The last crop from Tahiti has been very large, and prices have declined owing to the special flavour that can be used only by a limited number of buyers. The actual stocks in Paris and Bordeaux of Bourbon beans are 20,000 kilos. against 45,000 kilos. at the same time last year. The selection offered is not complete, and the cheap, short, common, and split sorts are not to be had. Hamburg has an insignificant stock, and London has very little. Prices have been advancing throughout the year from 55f. to 75f. net per kilo. for first quality, middle length 17 cm. The first lots prepared were sold at 60f. for Bourbon, and a few days since 62·50f. was paid, representing the parity of the net quotations in Europe. Seychelles vanilla is inquired for more than ever, and has reached hitherto unknown prices. The present stocks are not sufficient to last until the end of the year, and the first arrivals of the new crop will be quickly dealt with. At the London auctions prices have been constantly advancing and the demand has been good. Concluding, present quotations are likely to be well maintained, the prospects for the second part of the season depending on the amount of the Bourbon crop, prospects on the future crop, and, lastly, the general demand for consumption. The flowering of Seychelles vanilla is very short, and, as already stated, the next crop will be a small one.

LETTERS TO THE EDITOR.

COFFEE.

New York, *October* 21*st*, 1899.

Dear Sir,—The conditions which led to the lower values of Coffee in Brazil were primarily the high prices in the National currency there, which showed such an alluring profit to the planters that they increased the area under coffee cultivation to such an extent as to make a crop of 10,000,000 bags in Rio and Santos a natural result. Even this is not considered a *very* large crop under existing circumstances.

The high currency prices in Brazil were the natural result of the continued decline in the rate of sterling exchange there, commencing with the overthrow of Dom Pedro in 1889, when the value of the Milreis was above 27 pence, while now it is only SEVEN pence.

Over-production of Coffee differs considerably from over-production or surplus of almost every other kind of staple. Outside speculators probably do not realize that while wheat, corn and cotton have to be planted every season, the Coffee tree after the first four or five years bears fruit and continues to do so season after season for many years. They also do not realize that surplus Coffee cannot be diverted into other channels of consumption, like corn and cotton are liable to when prices are very low. Even at very low prices, the consumption of Coffee cannot be increased to anything like the extent of the present enormous production, and there is absolutely no way to improve values permanently, except by curtailment of production. This latter can be brought about in Brazil by doubling up the present sterling value of the Milreis and consequent relative reduction in the currency price. Now, in view of financial conditions in Brazil, when no tangible improvement has resulted from the three years' moratorium in the payment of their coupons, it is too much to expect that Brazilian finances can be improved sufficiently to double up the present sterling rate for the Milreis; the more so, as the entire element of planters and agriculturalists are stubbornly opposed to an advance in the sterling rate. Therefore, a curtailment of production is now contingent upon constant lower prices for Coffee in consuming countries until same reach a basis that would force the Milreis value in Brazil down from its present range of about 40 Milreis per bag, to 30 Milreis or less per bag.

From experienced Coffee merchants in Brazil we understand that a price of 30 Milreis or less, per bag, might seriously interfere with further cultivation and actually tend to a neglect of plantations now existing to an appreciable extent.

Unfortunately, for the achievement of such results, consuming markets have persistently encouraged Brazil to keep up the increased production of Coffee by repeated efforts to raise values in the face of continued accumulations of stocks, lower rates of exchange and high Milreis prices for the Coffee in Brazil. Every effort of this nature has postponed the possibility of reaching a sound market, or in other words getting down to a price where curtailment of production would naturally follow. Advances based upon anything else can be only temporary and ultimately cause more disaster and lower prices than would otherwise occur.

The world's visible supply of Coffee on October 1st was 8,036,556 bags, as against the highest figures of the world's visible two years ago—November 1st, 1897, 6,246,999 bags

(in a crop which turned out 10½ million bags in Rio and Santos). During that month of November the lowest figures were reached, and in Havre and Hamburg they were several francs and pfennigs, respectively, lower than they are to-day, notwithstanding that in the meantime an enormous addition has been made to the visible supply, and a very large increase taken place in the stocks in the interior (invisible supply); in addition to which a financial weakening has been in process among the Coffee trade in all the seaports of Europe and the United States, which certainly has not tended to increase the carrying capacity.

Reports from Brazil are uniform in stating that the prospects of the next crop are as favourable as can possibly be expected, so far as the season has advanced.

To illustrate how great the desire is to create higher values for Coffee, reasonably or otherwise, we need only to refer to the advance which was made in the Coffee markets on Thursday last on the reports of the appearance of the Bubonic plague at Santos. Only the wildest imagination could construe such a feature into a bull argument, as isolated cases of this disease have appeared in seaports elsewhere, without interfering with commerce in the least, and certainly cannot cause any disturbance in the cultivation or movement of Coffee in the interior. It may, however, add to the demoralization in exchange in Brazil, which is a decided bear argument. Such unhealthy speculative experiments like the one we refer to have been attempted, unfortunately, several times before, but they have always resulted in disastrous failures, rendering conditions finally so much weaker.

It has been claimed by Brazilian merchants that many large planters wish to continue raising large crops at low prices, as it is their desire to try and kill the competition of other Coffee-growing countries and thus acquire a monopoly for Brazil Coffee. This idea is entirely impracticable, as other countries will learn how to practice economy if Brazil can succeed on that principle.

We understand Brazilian planters are now raising their necessary cereals again, like Corn, Rice, Beans, etc. This is truly the first step towards successfully raising large crops of Coffee at low prices for the product.

Necessity is a good teacher to all mankind, and Brazilians have no monopoly of that experience. Planters in Venezuela, Central America, West Indies and elsewhere can learn and profit by it the same as Brazil, and in spite of continued talk of decreased plantations or smaller production of Coffee in other countries than Brazil, the total exports from such countries last year were in excess of the previous season, notwithstanding the small crop in Java. While a shortage may occur in one section, district or country, there is a compensating increase elsewhere, so that the total of one year is as large as another, if not larger. Economic achievements of raising large crops at low prices have been well demonstrated in respect to Sugar, Cotton, Corn, etc. Low prices resulting from over-production may remain more or less permanent, and Brazil as well as other Coffee countries will learn the lesson to produce Coffee at a price which heretofore has been considered unprofitable.

We can see no way out of present conditions, except by patiently waiting until the production shows signs of decrease —until natural causes bring about a reduction of supplies, and from all appearances such results are a long way off.

W. H. GROSSMAN & BRO.

GENERAL ARTICLES.

PLANTERS AND COOLIES.

We give, for the information of our readers, and wit view to criticism, the text of the Draft Bill to amend the relating to contracts between planters and labourers, dra in accordance with the resolution of the Government of In on the Report of the South of India Planters' Enquiry C mittee :—

PLANTERS' LABOUR BILL.

Whereas it is expedient to regulate the conditions of lab in the planting districts of the Presidency of Fort St. Geo and to provide for the enforcement of contracts entered i with labourers by planters or on their behalf: It is her enacted as follows :—

(1) This Act may be called the "Planters' Labour A 189 ."

(2) It extends to the whole of the Presidency of F St. George and it shall come into force at once.

2. In this Act, unless there is something repugn in the subject of context,—

(1) "*Employer*" means the planter for whom a labou has contracted to work, and, when such contract is made means of an agent or maistry, includes such agent or mais

(2) "*Estate*" means a tea, coffee, pepper, cardamom cinchona plantation.

(3) "*Labour Contract*" means an agreement to work an estate, or to bring labourers to work on an estate.

(4) "*Labourer*" means any person bound by a lab contract to work with his own hands upon an estate.

(5) "*Maistry*" means any person entering into an dertaking with a planter for the supply of labourers to w on an estate.

(6) "*Planter*" means the owner or manager of an es

3. And all words defined in the Indian Contract Act, of 1872, and used in this Act shall have the meanings resp ively assigned to them by that Act.

4. No contract under this Act shall be made for a t exceeding one year.

5. No contract made otherwise than in accordance the provisions of this Act shall be enforceable under this as a labour contract.

6. Notwithstanding anything to the contrary in the In Contract Act, 1872, it shall be lawful for any person ov age of sixteen and upwards to enter into a labour contra

7. Every labour contract under this Act shall be in w ing and shall be signed in the presence of a Magistrate an officer of the Registration Department, not inferio grade to a Sub-Registrar, or of the head of a village, some other person expressly authorised by Governmen name or in virtue of his office. It shall be the duty o officer or person before whom the contract is executed t that the contract is fully explained to the parties, and they understand its terms, and are desirous to fulfil the s

8. If any labourer shall, by reason of illness or acci be disabled from completing his contract, and the parties unable to agree as to the terms upon which the contract be determined, the employer may, and if the labourer desire, shall, send the labourer, or, if the labourer is u to travel, shall send notice to the nearest Magistrate, wh on inquiry he finds the labourer to be permanently dis

from completing the contract, shall declare the contract to be determined and such order shall be final. The Magistrate making such declaration shall likewise make such order regarding the repayment of the advance, if any, received by the labourer, as he shall deem fit.

9. Any labour contract under this Act may be determined by either party thereto on his giving two months' notice of his intention to do so. Provided that any labourer who desires so to determine his contract shall be bound, before quitting the estate to which the contract refers, to complete repayment to his employer of any advance of money which he has received in consideration of his engagement to work during the unexpired period of his contract.

10. Any labourer working under a contract made under this Act may determine his contract at any time on completing repayment to his employer of any advance which he has received in consideration of his engagement to work during the unexpired period of the contract, and on payment to his employer of a sum of annas three for each day of the unexpired period of the contract.

PROVISIONS AS TO ESTATES.

11. The District Magistrate, the Sub-Divisional Magistrate, the District Surgeon, and any other officer specially empowered by Government in this behalf, by name or in virtue of his office, shall have power to inspect any estate upon which labourers are working under labour contracts under this Act, and to enquire into the health and condition of the labourers and into the accommodation provided for them.

12. If it appears to the Government upon the report of a District Magistrate or Medical officer that any estate or portion of an estate is unfit for the residence of labourers or for any class of labourers, by reason of any sanitary defects which can be remedied, it may call upon the planter to remedy such defects within a period to be stated. If the planter neglects or omits to remedy such defects within the period so stated or if the estate is unfit for residence from causes which it is impossible to remedy, the Government may declare the estate to be unfit for the residence of labourers or of any class of labourers as the case may be. After such declaration has been made and so long as it remains in force no labourer, or no labourer of the particular class to which such declaration relates, as the case may be, shall be bound by any labour on such estate, or portion of such estate, as the case may be.

13. Every planter shall be bound to provide for the labourers employed upon his estate such house accommodation, water-supply, sanitary arrangements, and medical attendance as the Government may by rule direct.

14. Any labourer who shall be incapacitated by illness or accident from labour, shall, during such incapacity, be entitled to lodging and food, as well as medical care, at the expense of the planter upon whose estate he is employed.

Provided that such labourer shall not be entitled to receive, during such period his wages in addition.

Provided further that nothing herein contained shall prevent the employer from taking steps for the determination of the contract under section 8.

15. If any labourer states to the planter upon whose estate he is bound by contract to work that he desires to make a complaint to a Magistrate of personal ill-usage, or breach of any of the provisions of this Act or of any rule made thereunder the planter shall forthwith send such labourer to the nearest Magistrate who shall enquire into the complaint.

16. If, upon such enquiry the Magistrate is of opinion that the complaint is untrue or vexatious he shall dismiss the complaint, and shall specify in his order the number of days during which the complainant has been absent from his work in consequence of such complaint, and the labourer shall forfeit double the amount of his wages for those days.

17. If, upon such enquiry, the Magistrate finds that there is sufficient ground for proceeding with the case, he shall dispose of the case according to law.

18. If, upon the complaint of any labourer, it is proved to the satisfaction of a Magistrate that the wages of such labourer are in arrears for two months, or if wages due to any person whose labour contract has determined are proved to the satisfaction of a Magistrate to have been withheld after such determination, the Magistrate may award to such labourer or person the amout which appears to be then due to him; and also, by way of compensation, such further sum, not exceeding that amount, as to such Magistrate seems just; and the amount so awarded shall be recoverable from the employer in accordance with the provisions of the Criminal Procedure Code as if it were a fine.

If the amounts so awarded are not paid within a reasonable period or if it appears to the Magistrate that such amounts are unlikely to be recovered within a reasonable period by the distraint of the property of the person against whom the order is made, the Magistrate may, if the contract has not already determined, declare it to be cancelled.

19. Whenever it is proved to the satisfaction of a Magistrate—

(*a*) that any employer has been convicted of any offence causing injury to the person or loss or damage to the property of any labourer working under a labour contract for such employer, and under the Code of Criminal Procedure, 1898, triable exclusively by the Court of Sessions, or

(*b*) that any employer has been twice convicted of any such offence against such labourer and under the said Code triable by a Magistrate, or

(*c*) that any such labourer has been compelled by his employer to perform any labour while he was unfit for it, or has been subjected to ill-usuage by such employer,

such Magistrate may, if he thinks fit, on the application of the labourer aggrieved, cancel the labour contract of such labourer, and award to him compensation not exceeding thirty rupees.

PENALTIES AND PROCEDURE.

20. Whoever, being a maistry, fails without sufficient cause to present himself within the time specified in his agreement, with the labourers whom he has agreed to provide, shall be punished with imprisonment which may extend to six months or with a fine which may amount to five hundred rupees or with both, and the Magistrate may award to the planter out of the fine such compensation as he may deem fit.

21. Any maistry who, having contracted to supply labourers to work on an estate, without sufficient cause fails to supply, during the whole of the period to which his contract relates, the number of labourers whom he has contracted to supply shall be punished with imprisonment which may extend to six months or with a fine which may amount to five hundred rupees or with both, and the Magistrate may award to the planter out of the fine such compensation as he may deem fit.

22. Any planter, or any person acting under his orders, or on his behalf who wilfully obstructs any inspection or enquiry made under this Act shall be punished with fine which may extend to one hundred rupees.

23. Any planter, or employer, who compels any labourer to perform any labour knowing that he is at the time unfit to perform such labour shall be punished with fine which may extend to one hundred rupees.

24. Any planter who wilfully omits to provide house accommodation, water-supply, medical attendance, or sanitary arrangements in accordance with the provisions of this Act, or of any rule made hereunder shall be punished with fine which may extend to five hundred rupees.

25. Any labourer who, without sufficient cause, absents himself from his labour, or neglects or refuses to work, shall be liable to forfeit his wages for the days during which he has been absent or has refused to work and to pay to his employer a sum not exceeding four annas for each such day, and shall also be liable to imprisonment for a term not exceeding fourteen days.

EXPLANATION.

Ill-treatment of such labourer or failure of the employer to fulfil any condition of the labour contract is sufficient cause within the meaning of this section.

26. Whenever an employer or a person acting on his behalf complains to a Magistrate that a labourer has deserted from his estate, such Magistrate may, without previously examining the complainant, issue summons for the attendance of such labourer, or a warrant for his arrest, and fix a day for hearing the complaint.

27. Every labourer who deserts from an estate upon which he has contracted to labour, shall be punished with imprisonment for a term which may extend to one month or with fine which may extend to twenty rupees, or with both. For a second conviction for a like offence he shall be punished with imprisonment for a term which may extend to two months or with fine which may extend to fifty rupees, or with both. For a third and every subsequent conviction for a like offence he shall be punished with imprisonment for a term which may extend to three months or with fine which may extend to one hundred rupees, or with both.

28. If it appears to the Magistrate trying a labourer for deserting from an estate that such labourer was arrested without sufficient cause, such Magistrate may impose a fine, which may extend to fifty rupees, on the person by whom, or at whose instance, such labourer was arrested. The Magistrate may in his sentence direct that the whole or any part of such fine be paid by way of compensation to the labourer so arrested.

29. Any labourer guilty of drunkenness, or wilfully disregarding any sanitary regulation duly notified for the guidance of the labourers on the estate on which such labourer is employed, shall be punished with fine which may extend to five rupees, or with imprisonment for a term which may extend to one week.

30. The employer of any labourer sentenced to imprisonment for any offence under this Act may apply to the Magistrate, at any time previous to the expiry of such sentence, that such labourer be made over to him for the purpose of completing his labour-contract. On such application being made, the Magistrate may, if he thinks fit, order that such labourer be made over or forwarded to his employer.

31. Every employer who obtains an order of a Magistrate for the making over or forwarding of any labourer shall liable to defray the expense (if any) incurred in such mak over or forwarding; and shall, before the order is issu deposit with the Magistrate such sum as in the Magistra opinion necessary to defray such expense.

32. Whoever, knowing that any labourer is bound by labour-contract to labour for any employer, entices, or attem to entice such labourer to leave such employer, or harbo or employs any such labourer who has, in contravention the terms of his labour-contract left his employer shall punished with fine which may extend to two hundred rup or with imprisonment for a term which may extend to month, or with both.

The convicting Magistrate may in his discretion award the employer with whom such labourer has contracted whole or any part of any fine levied under this section.

33. Whoever, being bound under sections 8 and 15 cause any labourer to appear before a Magistrate wilfu omits or neglects so to do within a reasonable time, shall punished with a fine which may extend to two hundred rup

34. Whoever abets within the meaning of the Indian P Code any offence against this Act shall be punishable with punishment provided for such offence.

35. Whoever commits any offence against this Act shal triable for such offence in any place in which he may found, as well as in any other place in which he might tried under any law for the time being in force.

36. Nothing in this Act shall be deemed to prevent person from being prosecuted under any other law for act or omission which constitutes an offence against Act, or the rules made hereunder, or from being liable u any other law to any penalty higher than that provided this Act for such offence. Provided that no person shall punished twice for the same offence.

37. The Governor in Council may, at any time after date upon which this Act comes into force, by notificatio the *Fort St. George Gazette*, direct that processes issued u any Act for the enforcement of labour contracts in forc any Native State shall be executed within the Presidenc Fort St. George as if they were processes issued u this Act.

TEA AND COFFEE IN PARIS.

[FROM AN OCCASIONAL CORRESPONDENT.]

During the past few months there has been increased atte paid to the sale of tea in Paris. Many tea-rooms have been op which announce the sale of tea in liquor and in leaf, and m them advertise themselves as "Five o'Clock Tea Rooms" I c at one of the newest of these—a very small shop—the other and found that the business was being run by two young la daughters of an English clergyman. I tried their tea, and confess that if the same article were served in Regent-stre Piccadilly the trade done by that shop would be very small. tea was of a very thin and flavourless description, especially mixed with milk and sugar. I purchased one of their packe tea, which was sold to me at the rate of 4s. per lb., and on exa ing it I found the tea was such as would not find a very r market in England. I submitted it to an expert, who assure that it would be worth about 7d per lb. on the English ma to that has to be added about 2s. 3d. for duty and "octroi," b ing the cost of the article up to about 2s 10d. a lb. Curi enough it bore the name of a Swiss merchant, from whom I u stand it had been obtained. It is a pity that the French tas tea should not be educated with something better than this, b there can be little doubt that if the French consumers were t how to make tea properly, and were taught how to appreci

good cup of tea, a very great trade might be done in this article in France. There is, I am informed, to be an attempt to popularise tea in connection with the Indian and Ceylon sections of the Exhibition, but the restriction which has been laid down by the authorities that it shall not be sold within the precincts of the Exhibition is one which will very greatly handicap exhibitors. No doubt many of your English merchants have turned their attention to France as a country into which tea might be profitably introduced, but the failure which has attended their efforts in the past doubtless accounts for the slowness of English merchants at the present day to make a fresh attempt. As, however, there will be a great number of English-speaking tea-drinkers in Paris next year, no doubt a good opportunity will afford itself of making a fresh attempt. In the Exhibition year of 1889 some Englishmen did make the experiment of providing tea served in the English fashion, which met with a limited amount of success; but the numbers of English-speaking visitors next year, it is expected, will be greater than ever, and so it must be for the consideration of English merchants how far they will make another experiment in this direction.

I was agreeably surprised a few days ago to meet two or three well-known English grocers over here on the look-out for novelties for their home trade. It is evident that you have members of your trade in England who are enterprising and desirous of learning everything from personal observation which can be picked up here. There are many ways in which English grocers might well copy their French brethren—for example, something might be done to improve the sale of coffee in England if the French methods of roasting and blending coffees were employed. Hitherto the term "French coffee" in your country has been one of reproach, because, generally speaking, I believe "French coffee" as sold in England is an article which contains a small proportion of coffee with a large admixture of chicory. In a French home chicory would not be thought of; indeed, even the poorest amongst the French working classes appreciate a good cup of coffee. Whilst walking through the grounds of the Exhibition the other day I saw a boy grinding coffee to have it in readiness for the *déjeuner* of the workmen. One can hardly understand the English working classes being so careful in preparing coffee as to have it ground within half an hour of the time it was made, and there is no doubt that it is the fresh-roasting and grinding of the coffee, together with the skilful blending of various kinds of coffee, which produces the beverage which is so much admired by Englishmen when they come over to this country.—*The Grocer.*

INDIAN AND CEYLON TEA *vs.* OTHERS IN CANADA.

The steady expansion in the consumption of Ceylon and Indian teas in Canada; in fact, on the entire North American continent, has, says *The Canadian Grocer*, been one of the most notable circumstances of the tea market during recent years.

The increase in the inquiry for these teas first became important in Canada in 1896, and since then the gain has been steady. In fact, not a few traders contend that in the near future British-grown tea, that is, tea produced within the Empire, will take the premier position in Canada, to the detriment of Japans, which now hold the lead. As everyone in the trade knows, the latter drove China tea out of the average consumer's market, and now, if present indications are any criterion, it, in its turn, will have to succumb to new competitors.

Leading commission men assert that three years ago their turnover of Indian and Ceylon tea was a trifle, but that since then they have quadrupled their sales, so that the business is assuming large dimensions.

Previous to 1898 the Canadian Customs Department did not classify the imports of tea, but last year they commenced to do so, and the figures of the year afford reliable data for the question under consideration.

From these figures it is ascertained that the Canadian importations during 1898 were almost equally divided between blacks and greens, 9,841,976 lbs. of the latter and 9,494,587 lbs. of the former being brought into the country, a difference of 347,389 lbs. in favor of the former.

Ceylon and India's contribution in green tea was a trifling 120,128 lbs., but in blacks the two dependencies held the leading position. India sent us 1,992,919 lb., of a value of $313,220, and Ceylon 3,349,376 lbs., valued at $518,319, a total of 5,342,295 lbs., representing $831,539.

Contrasted with these figures, China supplied 3,323,335 lbs. or $427,895 worth, and Japan 828,957 lbs. or $100,588 worth of black tea, making a total of 4,152,292 lbs. or $528,483 worth.

Ceylon and India, therefore, sold us during 1898, 1,190,000 lbs. more black tea than the other two competing countries.

When green teas are turned to, however, it is at once seen where Japan holds the advantage. During the last year Japan sent us 8,378,520 lbs. of green tea, valued at $1,092,220, 3,035,225 lbs. more than both India and Ceylon's contributions of black, the excess of value in favor of Japan being $260,681. China only sent us 1,343,328 lbs. of green during 1898, valued at $150,000.

These figures show the standing last year, and, though no official data for the present year is yet to hand, well-informed men in the trade contend that the importation of Indians and Ceylons this year will show an improvement over that of last year.

It is worthy of note also that the cost of the average Indian or Ceylon tea is 4c. per pound higher than the Japan, that is to say, the Indian or Ceylon tea in most general consumption here ranges from 17c. and 18c., as against 14c. and 15c. for Japan.

The flavor of the former, however, evidently pleases the popular palate, and as it is heavier, with more in it for less money, than the China black, it is ousting both the latter and Japan from the Canadian market.

LONDON TEA CHARGES, ETC.

A London correspondent of a Colombo paper writes *inter alia*:—

THE TEA WEIGHMENT NEGOTIATIONS.

Though the clash of arms echoes from South Africa the daily round of business in the City goes on all the same, and the weighment negotiations drag their slow length along. The importers not being in a position to go to the Customs and unite in urging the carrying out of the agreement in full, the tea buyers went alone. I was fortunate enough yesterday to catch Mr. Appleton as he returned from the Customs, and to hear the latest news such as it is. Mr. Appleton has been described as a fire-eater. I have no reason to endorse this description of him, but he is a man who knows his own mind, and goes straight to the point—not a bad thing, perhaps, in these days of flabbiness. After pointedly asking why I came to him and not to the importers whom he evidently thought the proper source of information for a planting journal, he proceeded to give me his views on the matter in hand. The Customs charge for taring was ridiculous. Lifting a chair from the corner of the office and going through the action of putting it on a beam scale, "*That*," said Mr. Appleton, "is the work for which the Customs charge us 6d.!" "And about Mr. Brooke's objection?" "We look upon Mr. Brooke's objections as frivolous. In any case though they may be a reason for getting the Customs charges reduced, they can be none whatever for breaking through an agreement deliberately come to." "You may take it from me," said Mr. Appleton, "that we are going to carry out this agreement in full, or not at all."

Not much encouragement here from an Importer's point of view. The Customs, I gathered, had listened to the buyers' arguments, put before them, one may be sure, in a forcible way and with no importers there to criticise; but as is their way, they did not commit themselves to any particular course of action. And so the matter rests

WAREHOUSE CHARGES.

The tea clearing-house Committee and the Indian Association had an Amicable Meeting on Monday, and strong hopes are expressed that the Warehouses will consent to the reduction asked, *viz.*, that a fixed discount of 25 per cent. should be given in place of the 10 per cent. which is now supposed to be allowed, but more than which is often given. I have good authority for saying that the head of one of the largest warehouses has already expressed his willingness to meet the views of importers, and if one gives way the others sooner or later must follow suit. A good deal of light has been thrown on the dark and tortuous ways of warehouses by the three incisive articles which lately appeared in the *Investors'*

Review, and with which you have no doubt dealt. Another article has now appeared in a trade publication written by the Chairman of a large distributing Company, which gives the dealer's view of the matter. The article opens with some tables showing that the charges on one ton of British-grown tea amount to no less than £4 0s. 2d., against 17s. 2d., on one ton of coffee, a sufficiently startling illustration of the high charges made by the warehouse monopoly. I am enclosing the article in its entirety It is of great interest as showing that the trade is as much opposed as planters can be to the present system. To my mind the most objectionable feature in the whole matter is the secret nature of the reductions given, secret that is as far as the outside public is concerned, for they are no doubt known to the clearing-house Committee. It is generally believed that anyone going to a warehouse (I do not say this applies to all warehouses) and offering a *quid pro quo* in the shape of business, can secure terms which would be indignantly refused to any ordinary person. This is not as it should be. Then again the question arises: if one employs as agent a man who is a shareholder in a wharf or warehouse, is one entitled to a full share in the reduction he gets? I know that in some cases the rebates and discounts given are handed over *pro rata* to the proprietor or company interested, but it may be doubted if this is always done. You will find the present system of weight-notes and warrants, which has always seemed to me a very cumbrous arrangement, touched on in the article, and it should be impossible, with the experience of other trades for guidance, to devise some simpler method of procedure.

THE QUALITY OF CEYLON COFFEE.

Talking to a coffee dealer the other day, I asked him whether the coffee now coming from Ceylon was equal in quality to what was sent in the days before Leaf disease and Green Bug appeared He was strongly of opinion that the beans nowadays had a woody flavour and want of fullness compared with what used to be sent I asked him further whether the general cheapness of coffee was stimulating the consumption, and he informed me that there was a slight increase, and that a good many firms, now that the profits on tea were cut so fine, were turning their attention to coffee.

I lately came across a use of coffee which was new to me. On a counter in an American Bar were little saucers of roasted beans for sweetening the breath. They were specially in favour, I was told, with married men! We know that

> Great Cæsar dead and turned to clay
> May stop a hole to keep the wind away,

but it does seem a come down for "King Coffee" to serve to cover the delinquencies of erring Benedicts.

THE COOLY IN SOUTH INDIA.

"Producer" writes in *Capital*:—

Some little time ago I showed that a net price of 60s. a cwt. for coffee left little margin for profit on an average well-culivated coffee estate in South India. As it turned out, in the first half of this year coffee netted only about 45s. a cwt., and a good deal is selling now for much less than that price Considering that this is against an average of 85s. a cwt. for the last ten years, it is evident that the planter must reduce his expenses by one-half to balance his ledger. This state of things is entirely due to the flooding of the market with cheap Brazil coffee which, thanks to an 8d. milreis, the Brazilian can now put in London for about 25s. a cwt. In 1885 with much lower rates of wages than he has to pay now, but with a 22d. milreis, the Brazilian could not put his coffee in London at a profit at 40s. a cwt. The first person to suffer from the reduction of expenditure thus forced on the Indian planter is, of course, the cooly Accordingly in every planting district of Southern India we find numbers of coolies refused work; and this at a time when, owing to high prices for grain caused by the prospect of famine in the north of India, coolies are most anxious to get work. Railways are most efficient means of fighting famines in famine districts, but they unfortunately also have the effect of spreading famine prices all over India, and into districts where there is no organised system of Government relief As long as the cooly can get plenty of well paid work, it may be argued he also benefits by the high prices obtained for agricultural produce. But if he can't he had better migrate, if possible, to a famine district, where a paternal Government will take care of him. And this is actually the position of large masses of coolies accustomed to w on coffee plantations in South India. The Government of In has decreed that "the unfair gain which the employer make the expense of his employè by means of low exchange" shall ce or anyhow be limited, by the fixing of Indian exchange at The result of this benevolent action of Government is that coffee planter having now no gain at all, fair or unfair, is v much against his will forced to abstain from taking an unfair vantage of large numbers of his employès by the summary proc of refusing them any work at all. In some districts reduction wages have been enforced, and there is a talk of reduction in oth Whether wages are reduced, or work refused, it is evident that is not the cooly who benefits by the employer being mulcted of unfair gains by exchange. The present state of affairs affords apt illustration of the truism that the cooly can only become m prosperous when his employer is prospering, and if the emplo suffer losses of any magnitude the cooly is bound to suffer his sh of them. The worst sufferers at present are the slave tribes Malabar. Although they are only employed for short terms small advances when it suits their owners to send them up to "coffee lands," they have for many years been accustomed to work on the plantations for about six months in the year. some months now they have nearly all been refused work on pla ation, and their position is made worse by the partial failure of rice crop in Malabar for want of seasonable rain. Piteous appe for work constantly come to the planter, but the pressure is severe that planters, with Rs.500 out in advances on low coun coolies, are forced to refuse to employ them. The same is happ ing to the Tamil coolies of Coimbatore; coolies under considera advances are being sent away, and told to come again next y when prices may be better Even the favourite Canarese co from Mysore, whom planters are generally only too anxious employ if they can get him, is being sent empty away. Both Ta and Canarese coolies have come in, in largely increased numb this year, which shows they are not so well off in their villages they were.

It was unfortunately not possible at the time of the Curre Committee to produce such a striking example of the effec fixing exchange, as the present condition of the coffee indus affords, on any industry which, though it may trade with a g standard country, has to compete in that trade with another co try with a nominal gold standard and much depreciated pa currency. Before the Currency Committee the planting indus was represented by tea planters, and it was easy to show they thoroughly worsted China, and were really benefited by a chec the rapid extension of tea in India. But it is a bad omen for effect of the Currency policy in the trade of India generally, t such a crisis, as now obtains in coffee, should occur immediat after the recommendation of that policy by the Committee. It perhaps needless to remark that no cheap European capital forthcoming for investment in any planting enterprise at prese and the cooly is the main sufferer from its absence. It is estima some 3¼ lakhs of people were employed on South India plantati in 1896, of which the great mass are employed in coffee growi This is about the same number as the tea industry of Ass employs.

CEYLON AND INDIA TEAS IN THE UNITED STATES.

The *American Grocer* remarks:—

The London market, the great tea mart of the world, was ul lately controlled by a few large buyers, who, by agreeing betwe themselves to remain out of the market for a sale or two, co readily depress prices. These buyers were, and are, the represe atives of the large packet tea concerns, and are by force circumstances necessarily "bears," because the tea they buy is up in packets and sold at fixed prices, to which the consum public has been educated. It can be readily seen that with ev change of the market to a higher basis, the price of the packet the consumer could not be changed; hence the packet tea bu must purchase at a low price or sustain a serious loss.

With the American business an important factor in the Lon market, such a combination becomes unavailing at once, as th are always ready buyers of Ceylon and India tea here when Lon prices go beyond a certain limit.

Formerly China tea at 8 cents a pound came into competition with the pure teas of Ceylon and India, which cost twelve to thirteen cents to land. Through the strict enforcement of the standards by the United States Government, those inferior "compounds" are entirely excluded, and China tea cannot be bought under twelve to thirteen cents a pound, which brings the two classes of tea practically to a parity, and, at the same price, the more desirable for blending or any purpose is the machine-made tea of Ceylon and India.

Thus it will be seen that the operations of the American buyers immediately nullify any contemplated "bear" movement in London, as the offers to buy at a price for export to America are always in evidence there. The result will be that possibly after one or two "bear" attacks the combination will have to fall into line and buy at market rates in self-defence

With the consumption of Ceylon and India tea increasing here, in Great Britain, and, in fact, all over the world, the trend of price is upwards, and after the British "bear" combination has been compelled to buy at current values, the American buying interest will have to raise its limit also, and in that way values will reach a still higher level. Certain it is that prices are looking upward, and there is nothing in existing conditions that would make shrewd tea buyers hope for or expect lower values.

Another strong factor which tends to lessen the influence of the combine of packet tea buyers in London upon the world's market is the great number of orders now sent direct to Colombo and Calcutta from houses in America, Russia, and Australia.

TEA IN PARIS.

A correspondent of a Ceylon contemporary gives the price list of leading tea rooms in Paris :—

AFTERNOON TEA.

THE KARDOMAH TEA ROOMS.

TARIF.

	Per large cup. centimes.
Delicious tea with cream or lemon	30
Bread and Butter, Plum or Seed Cake or Biscuits included ...	60
Finest coffee with or without cream	40
Bread and Butter, Plum or Seed Cake or Biscuits included ...	60
Chocolate or Cocoa	40
With Bread and Butter, Cake or Biscuits	70
Boiled eggs up to 2·30 p.m. ... ... (each)	30
Milk hot or cold	30
With Bread and Butter, Cake or Biscuits	60
Fresh Lemonade ... ... (per glass)	40
Vanilla Ice Cream with Wafers	60
Extras: Pot of Cream	10
Bread and Butter, Cake or Biscuits	25
Serviette	10
Ladies' Toilet room	10
Serviette	5

The "Kardomah" tea rooms are opened to advertise and popularise our famous "Kardomah" teas, but visitors are under no obligation to make purchases at the counter.

The tea used is our celebrated "Kardomah" Blend, 5 fcs. per 1/2 kilo.; and the coffee is the finest obtainable, 3,70 per 1/2 kilo.

The tea rooms are open from 10·30 a.m. to 6·30 p.m., and Customers are served quickly.

The Liverpool China and India Tea Company, Limited. (Two minutes from the Louvre) 184—Rue de Rivoli—184 (corner of the Rue de l'Echelle), Paris.

Nota.—No connection with any other house in Paris.

TEA, ETC., COMPANIES.

The Carolina Tea Company of Ceylon.—The actual tea crop from the Company's properties for the year ending 30th June 1899 was 961,757lbs as against an out-turn for the previous year of 939,491lbs., in addition to which 32,862 lbs. tea were made from purchased leaf. The cost of the tea free on board Colombo, was 4·61d. per lb., as against 5·10d for the previous season. The average gross sale price in London was 7·65d. as against 8·02d in 1897-1898. The crop of Cocoa has increased from 441 cwts. to 555 cwts.

The sum of £1,200 has been added again to the Reserve Fund, bringing up the total of this account to £8,400.

THE DIRECTOR OF THE PERADENIYA GARDENS.

Mr. J. C. Willis, Director of the Royal Botanical Gardens at Peradeniya, has returned to Ceylon after an absence of five months on leave. We extract the following from an interview reported in the *Times of Ceylon* :—

UNNAMED PLANTS.

He also took home about five hundred plants to have them named. They had been accumulating here for about five or six years, and, as has been done before, he took them to Kew to be named, as there were no facilities for doing that here. They were all named, and, as usual, the original plants were left there. They did not bring them away once they took them home for any purpose.

RUBBER: ITS CULTIVATION AND PREPARATION.

Mr. Willis added that he also took home several specimens of rubber—Para rubber—prepared from the juice obtained from the trees growing in those Gardens. Rubber, he continued, could hardly be termed one of the exports of the island yet, because so very little of it was being exported that the quantity was not shewn in the Customs Returns. Last year there was only, he believed, about half a ton shipped from Ceylon, at any rate very little of it. Rubber—Ceara rubber of rough manufacture—was, however, exported pretty largely about ten years ago, but there had been such a falling off since that rubber could hardly now be classed as one of the island's exports. During the past five or six years, however, the cultivation of Para rubber had been extending considerably, and there were now between 1,000 and 1,500 acres, roughly speaking, of Para rubber under cultivation. A number of planters were going in for it. Just after he left the island there was a sale by public auction of a large quantity of Para rubber seed, which was obtained from the Gardens as well as from the Forest Department, and the seed was very largely purchased. It was, of course, a low-country product, and Kandy was about as high an elevation, perhaps, as it could be grown at with any prospects of a profitable return.

THE NEW METHODS OF PREPARING RUBBER.

Pointing to a pamphlet on the table, Mr. Willis said that that was a circular published by him, with a preface and concluding remarks of his own, containing full information regarding the methods recommended by Mr. Parkin for the preparation of rubber with the aid of chemical acids.

"How was it usually prepared before?"

"There was really no preparation about it. The juice was tapped from the trees and simply left to dry—a very rough and primitive way of doing it!"

"And the specimens you took home, how were they prepared?"

"With the aid of chemical acids. They were the first specimens of the kind taken home. The rubber obtained under the new process is much cleaner, and naturally so. I took them home to find out what prices they were likely to fetch in the market."

"How did they compare with the specimens from elsewhere?"

"Well, I am not a professional rubber-broker, and I can only give an approximate idea of the quality of specimens of the product, but, so far as I could see, I don't think they compared at all unfavourably with the other specimens in the market, and appeared to be as good as most of them. However, I have not yet received the official valuations, and when they come we shall know definitely. I may possibly be getting them in January or February. They will be published immediately I receive them."

"What is the area under rubber in the gardens here?"

"About two acres nearly; we have 500 Para rubber trees planted 12 feet by 12 apart. They vary in age from about 12 years to 25 years. Some of them are very old plants, and all were planted a good many years before I came here. The specimens of rubber I took home were prepared from the juice of these trees, but, you see, these specimens, unlike those that had been taken or sent home before, were specially prepared according to the new methods as recommended by Mr. Parkin, and therefore it is that it will be interesting to know what the brokers think of them."

"Of the thousand odd acres under Para rubber cultivation in the island, about what proportion has already reached the bearing stage?"

"Most of the trees, I believe, are now between one and eight years old. It is not till they are ten years old that they are generally tapped, so that in about three years from now we ought to be

shipping some rubber from Ceylon, and in about ten years more a good deal of it."

PLANT DISEASES.

Mr. Willis said he also took home some diseased plants, with a view of having them more thoroughly and scientifically examined than he had either the time or the necessary apparatus to do here. These consisted of three sets of diseased tea-plants (three diseases); a diseased betel plant; and a diseased camphor plant. Each of these is being very carefully examined, and the reports on the different diseases will in due course be published in the *Kew Bulletin*. The existence of these diseases showed the necessity for the appointment of a Cryptogamist whose whole time and attention could be devoted to investigations in this direction, which was not what Mr. Willis, with all his other work, was able to do.

THE PROSPECTS OF COFFEE PLANTING IN BRAZIL.

Since the commencement of 1897, when the big crop of coffee occurred, the position of coffee has been growing from bad to worse, says the *Brazilian Review*, until it seems to have culminated in prices that in many districts do not cover cost, and, even in the most favoured, leave but a bare margin of profit, insufficient to compensate the capital employed. On July 1, 1896, the visible supply stood at 160,320 tons, grew to 239,000 on December 31 of the same year, and reaching 386,860 on December 31, 1898, has gone on growing ever since, threatening to reach 400,000 before the end of the year. The increase in quantity was followed, naturally, by depreciation, and prices, which were maintained between 80 and 90 francs until 1896, fell to 47 in 1897, 35-50 in 1898, and, lastly, to 32, the current price at Havre. In 1895-96 the production of Brazil coffee was 5,480,000 bags; in 1897-98 it had risen to nearly 11,000,000!

Under such conditions the fall of prices, though certainly exaggerated and facilitated by the simultaneous depreciation of the currency, was inevitable, nor is there any hope of any considerable improvement until production and consumption are more closely balanced, either by the shrinkage of the former, or increase of the latter, or both.

The state of things now obtaining amongst planters leads to the belief that, before very long, production must undergo a considerable modification unless artificially fostered. Overloaded with debt, unable, not only to meet their mortgage charges, but, what is worse, to even compensate labour adequately, the difficulties of the planter are becoming so overwhelming as to make it impossible to many to maintain the struggle much longer. Mortgages may, it is true, press hard upon the planter, but after all, when purchasers are not to be found and creditors see no means of even working the estate without loss on any terms whatever, few, and certainly not the banks, will be particularly anxious to foreclose. There are, of course, some foreclosures even on such conditions, and if anyone expects to purchase "fazendas" (plantations) even now at the ruination prices referred to in the leading article of the *Rio News*, of September 19, he would be sadly disappointed.

In fact, plantations are sold at the rate of 1$ (one milreis = 8d.) per tree to-day, as they have been for the past 20 years, the alteration being in the value of the milreis; and, were the matter examined into, it would be found that the plantation, costing over 500,000$, that our contemporary represents as having been sold for only 10,000$, or 1-50th of the cost, was probably mortgaged up to its full value at that valuation, and that the cash payment of 10,000$ represented in reality so much paid over true value to get possession or to avoid transfer duties. No estate ever worth 500,000$, on which 150,000$ had been spent in improvements, could, by any possibility, go for only 10,000$. The buildings, stock, and machinery alone would be worth many times that sum, not to mention the land, which can be put to other uses beside coffee-planting. No doubt the crisis is bad enough, but things have not reached such a pass that plantations are actually given away.

The most serious feature of the situation, from a planter's point of view, is that at present prices coffee does not yield sufficient to pay for labour. Wages, which were never high, have, consequently, been dropping, and as they drop labourers, who are chiefly Italians and nomadic, emigrate. Some 15,000 are said to have left San Paulo during the last two or three months, and, should the exodus continue, there can be no doubt that labour will not only be insufficient, but that wages will rise to still higher and more prohibitive rates. In that case, unless exchange should fall proportionately, which seems not unlikely, there is every chance of labour in San Paulo being short, and that a good deal of the next crop will remain unpicked, at least, in outlying districts. So far, reports of the flowering both in San Paulo and Rio are most favourable, but, without labour to pick it, the heaviest and most promising crop will not avail the planter.

In regard to Minas and Rio the conditions are somewhat different. In these two States labour is chiefly local and attached to the plantations by a share system in lieu of wages. Being paid in kind, the planter is more independent than his San Paulo colleague, and though the yield is far smaller in San Paulo, succeeds better in retaining labour on the estate.

Should the expectation of scarcity of labour be realised, there can be little doubt that next year's crop will suffer, and that, though undoubtedly painful to the individual planter, in the long run will not be so injurious to general interests as it appears. The *Rio News*, consistent to the end, hysterically calls on Government to reduce taxation and save this, "the great agricultural industry of the country, on which,' it says, "its credit depends from serious disaster." Taxation, of course, is a very bad thing always, and over-taxation still worse. But even the *Rio News* will scarcely maintain that Government is, except in an indirect manner, responsible for the over-production of coffee, to which, if statistics are to be trusted, the fall of prices, and, consequently, the difficulties of the planter are due. Nor, indeed, is it clear that even if taxation were abolished altogether, the equilibrium between the supply and demand for coffee that can alone make prices, we will not say rise, but keep from falling lower still. It is not clear that any relief that would again reduce the cost of production and do very must, at the present moment, tend to increase, in lieu of diminishing, the supply, and to, therefore further depress prices. Should the State Governments remove the 11 per cent. tax to-morrow, it is certain that the producer would gain a corresponding advantage, or would not prices rather fall still further abroad in consequence? Either prices are or they are not controlled by the relation of supply to demand. If they are, as economists generally suppose, so long as the supply be largely in excess of the demand for coffee, cost may be reduced here and revenue be sacrificed, but without benefit to anyone except to foreign consumers. At present the kindest thing to be done is, if anything, to hasten the liquidation of an industry that, under existing circumstances, has become unprofitable. To stimulate production further in any manner when coffee is a positive drug in the market, could only prolong the agony.

What happened with cotton in the United States will, unless production be checked, occur here, too, and low prices and small profits persist for years until demand commence to gain upon supply. Here, too, the problem is more complex, because there is practically no other industry to fall back upon. It is on this account that the prosperity of the coffee industry is of such vital importance, because upon it the whole financial and economic edifice depend. In the interest of the country generally, it seems therefore, requisite that nothing should be done that can interfere with the indispensable and wholesome liquidation that is now in process, of an industry so inflated as to prove an impediment and menace to the general welfare. The coffee boom, like all others has run its course, burst, and, naturally, hurt a lot of people in the process. The sooner it is finally liquidated, and the industry placed on a solid and paying basis, the better.

CARDAMOMS AND PEPPER.

The *London Commercial Record* remarks :—

It will be of interest to those of our readers who use or deal in East Indian Cardamoms to hear that the latest reports regarding the crop in the Mysore district are very unsatisfactory. Not only has the weather been greatly disappointing to growers, but to intensify the calamity, the Cardamoms are suffering from "Poochies." There are instances where no less than a quarter of the crop has been attacked by weevils, which have absolutely destroyed the berry they have bored. Other estates have been more fortunate, but poochies exist practically everywhere in a more or less pronounced form. Planters are naturally greatly distressed in consequence, and talk about dropping the cultivation of Cardamoms, no wonder, for, quite apart from the present visitation of in-

the prices London has paid during the last few years for these fine-flavoured berries have been next to ruinous to the cultivators. They have hardly paid for the labour, and the result has been that very few packages have found their way into our market. What has been grown has been sent to Arabia, or has been consumed in India, where better values have been realised than in the market of the world—London. The fact is, ever since Ceylon has appeared as rival-cultivator of Cardamoms, East India descriptions, although of a fine flavour, have slowly but surely been ousted out of the market, Ceylon sorts being not only of a sufficiently good quality to suit most purposes, but being also considerably cheaper. Real Mysore and Malabar berries have practically become things of the past—as far as the general use is concerned, whereas Ceylon sorts are gaining in importance almost every year They have become a valuable by-product to tea growing, and are enjoying therefore special care and attention on the part of almost all tea planters. East Indian growers seem to recognise the fact that their fine berries are no longer a current market article, but have attained the character of a speciality, and they hope to find a suitable substitute in Pepper. This they can grow together with their Coffee, and ever since the decay of the Pepper cultivation in the Straits, more attention has been paid in India to the growing of this spice, and a most marked development has taken place during the last few years. Europe has not been slow in recognising the superior quality of Tellicherry Pepper, and even London dealers, in spite of their usual conservatism, have shown considerable interest in Black Tellicherry. We all know what an extensive business has been done in it during last winter and spring, and, although there has not been particularly good demand for it during the summer months, this is not owing to a declining interest in Tellicherry, but to a general stagnation in the whole Pepper trade. Last week an improvement in the market set in, caused, no doubt, principally by exceptionally small supplies from Singapore during the first half of October; the astonishing part is that the movement should have died away so quickly. It may interest our readers to hear that the exports from Singapore and Penang from the 1st January, 1899, till the 30th September amounted to 7,150 tons. as against 8,080 tons during the same period in 1898. Of these quantities—

	1898.	1899.
England took	4,280 tons	2,670 tons
America „	1,800 „	2,220 „
And the Continent took	2,000 „	2,260 „
	8,080 „	7,150 „

England, according to these figures, is much behind in its requirements; but we may take it for granted that an improved demand from London will soon alter the statistical position.

THE CURING OF TOBACCO.

With reference to the inquiry made in our last issue, we quote from the *Southern Tobacco Journal* the following article on curing leaf for cigars. It shows the style of barn to be erected and is entitled

CIGAR LEAF-CURING BARN.

The style of tobacco barn generally adopted in Florida corresponds closely to that of Cuba, being wide and low rather than high and narrow, as in the Northern States. It should run from north to south the long way. Of whatever length it is built, take half the length *minus* 1 foot for the breadth, and with these dimensions a well-shaped barn will be constructed. For instance, a barn 20 feet long would be 9 feet wide. Two-thirds of the width is taken for the length of the rafters. A thatched barn in Cuba would add 1 foot to the above length in order to make a steeper pitch to give the rainfall a more rapid descent. The posts are to be 12 feet from the ground to the eaves.

A house of these dimensions is to be divided into sections, allowing a space of 27 inches between each two sections, so that a man may easily get in to put up or bring down the poles. The same space, 27 inches, should be left at each end, between the wall and the pole racks, to afford the same facility. A passage 3 feet in width should be left, dividing the barn into two equal parts; and each half will have four sections in each side of the passage. There will thus be eight sections, and each of these will have an area of 4 square yards. The apartments are formed by posts.

The poles for a barn of the foregoing description must be at least 13 feet long.

The poles filled with tobacco are placed on strong rails of the length of the sections, nailed horizontally on the posts which form the sections, *viz.*, about 3 feet, so that the tips of the leaves of one rack shall not touch those next below. This is for the tobacco cut up Cuban fashion, in saddles of two leaves, while for primed tobacco the interval may be shorter, as the leaves do not hang down a yard.

A window or ventilator must be left at the top of each gable, and all around the ends and sides the windows or shutters should not be over 5 or 6 feet apart, and hinged at the top so that the bottom can be slightly swung out to admit the air without permitting the sunshine to enter. In a damp locality the siding and ventilators should be well tight to exclude the moisture when it is excessive.

THE ACTIVE MEN OF THE EAST SIDE OF THE UNITED STATES.

THIRTY YEARS AGO AND NOW.

The following extracts from a paper by Mr. John B. Summerfield, in the *American Grocer*, should interest our readers. If the English tea trade has its Lipton, the American tea and coffee trades evidently have their "strong men," too, and have a history that can show a goodly array of business talent, enterprise and prosperity :—

Congratulating you on this your thirtieth anniversary, my mind runs back to the active men engaged in the tea, coffee and sugar business on the east side of this city when your valued paper sprang into existence. Front street and lower Wall street were busy places in those days.

Coffee, tea and sugar came nearly all together in sailing vessels, and were sold to the wholesale men in lines or by the cargo, and they would break them up and sell to the smaller city jobbers and out-of-town trade. Sugar was frequently sold at auction on Hanover Square or on the dock in New York or Brooklyn. It would be sold in lots of, say, ten packages, with the privilege, but sometimes a buyer would take the whole cargo. These sugars were resold by the jobbers in original packages to their customers all over the country, many preferring raw to refined sugars, which were used in those days much more sparingly than now.

Mr. B. G. Arnold, whose firm had succeeded the old firm of Sturges, Bennett & Co., was the leading man in the coffee trade. He was a broad, liberal minded man. He bought and sold in a large way, and had a following of active, aggressive men such as Bowie Dash, of Bowie Dash & Co.; O. G. Kimball, of Dwinell & Co., of Boston, and many others.

Pupke & Reid were large coffee dealers. Mr. Pupke, of this firm, had formerly been of the firm of Pupke & Thurber. He was an excellent business man and was not afraid to sell goods at a loss when his judgment warranted it

The large tea importers were A. A. Low & Bros., Weston & Gray and John Caswell & Co., all firms of the highest character, composed of men whose word was as good as their bond.

During the war the fortunate arrival of a cargo of tea, put nearly three-quarters of a million to the credit of A. A. Low & Bros. . . .

Nearly all the importations of sugar, tea and coffee were sold to the jobbers on credit, they giving their notes to the importers, who sold them on the street or carried them, as they saw fit. The jobbers distributed these goods, and were a busy lot, and included such firms as Stanton, Sheldon & Co., E. W. Tiers & Co., Earle & Co., Ives, Beecher & Co., Gross, March & Co., Roswell, Skeel & Co, Sherman, Tallman & Co., Gill, Gillets & Noyes and Goodridge & Walker.

Joseph Wilde was another of the famous coffee traders of thirty years ago, and one of those sterling men whose noble character commanded homage. He was a just man. The history of his firm dates back to 1814. The house has had afloat at one time cargoes of coffee valued at a million dollars, and has made single sales as high as 16,000 mats. His brother Samuel has also passed away, and he, too, was a high minded, public spirited man and thorough merchant. . . .

It is pleasant to think of these old times, and some, perhaps, will say that they were much better than the present; but when the

field is looked over the ruling men of to-day compare favorably with those of years gone by, and the opportunities in business probably are as great as ever.

Lower Wall street is now represented by many brainy men. . . The tea business is largely controlled by Carter, Macy & Co. and Irwin, McBride, Catherwood & Co.. Mr. George H. Macy, the senior partner of Carter, Macy & Co., is conceded to be the most aggressive man in the trade, quick pushing and active, keeping his large business on the move all the time. Russell & Co are enterprising people, and are pushing to the front in this line. Montgomery & Aull, whose fathers before them sold tea, have a fine and growing business.

The coffee trade of to-day, with steam and electricity to keep the markets of the world in touch with each other, requires men who, if they wish for success, must look far ahead. Such a man is Mr. Herman Sielcken, of W. H. Crossman & Brother. His judgment seems to be sound, and his far-reaching mind rightly divines the probabilities of the future. His management, not only of his own large business, but also of the Woolson Spice Company, the roasters of the Lion brand of coffee, has been very successful.

Mr. James N. Jarvie, of Arbuckle Brothers, is another of the brilliant men of the coffee and sugar trade, quick in his movements. With a mind to grasp many things, he is enabled to do an enormous amount of work in his business and as director in a half dozen or more financial institutions of this city.

One of the best-ordered firms in this trade, and which does a large importing and distributing business, is Hard & Rand. Mr. Rand is probably the least demonstrative man in the trade, always calm and placid, with a knowledge concerning mercantile affairs, and especially in his own line, exceeded by none. He is, what may be termed, a first-class merchant of this or any other age.

When we look at the active men of to-day, as well as those of thirty years ago, we find, with but few exceptions, they are men who have made their own way. This should be an incentive to the young men of the present time not to be discouraged or to think that the old times were so much better than the present, but rather to believe that the chances for hardworking, painstaking young men are as favorable now as ever before.

INDIAN AND CEYLON TEA.

We append the Indian Tea Association's Monthly Return of Sailings and Daily Customs Entries of Tea from Calcutta, and also a Return of Exports of Ceylon tea for four years up to the 31st October 1899 :—

DISTRICT ASSOCIATIONS.

COORG.

PROCEEDINGS OF QUARTERLY GENERAL MEETING of the Co Planters' Association held at Mercara, 28th October, 18 PRESENT:—Messrs. R. Tatham, G. K. Martin, W. M. Ball, C. Nunjappah, P. Beni-Singh, E. J. Cockerton, A. Wright, J. S. Finl son, G. R. Pearse, W. G. Deedes, J. T. Morgan, C. W. Wood, J. Irwin, H. F. Davy, W. H. Sprott, G. F. Meiklejohn (*Commissio of Coorg*).

The Chairman, Mr. Sprott, opened the meeting with a repor the delegates to W. P. A. S. I. and spoke chiefly about the Labor Act, proposed Coffee Shop at Paris Exhibition, and deteri tion of E. I. Coffee, and asked Mr. R. Tatham to give the meet his views on the latter question.

The meeting approved of the action of the delegates at W. P. A. S. I. Meeting and congratulated Mr. Sprott upon his be elected Chairman—

Proposed by Mr. Ball, seconded by Mr. Pearse, that a vote thanks be given to the delegates (carried unanimously).

Tatham then made a few remarks on E. I. Coffee, in which he s that, though our coffee had no doubt deteriorated during the two or three seasons, he put it down more to abnormal seasons th to anything else. He also seemed to think that perhaps contin attacks of leaf-disease had somewhat weakened the trees, wh might partly account for it. He added that from enquiries he l made from firms in England in regard to improved plant machinery for curing purposes, that it would seem that none exis which was not known to the curing firms. In regard to Acworth's remarks at the general meeting of the United Planter Association to the effect that he had it on the authority of Mr. J. Sanderson, that the deterioration of coffee was due to bad curi Mr. Tatham stated that he had received a letter from Mes Sanderson & Co., in which that firm wrote that Mr. John Sander has no recollection of having made any such remark to Mr. Acwor

Paris Exhibition.—The Chairman explained what was proposed be done by the W. P. A. S. I. about the Paris Exhibition say and it had been determined to exhibit a case with samples of products of each district, that he, as Chairman of W. P. A. S had appealed to the various Governments for help to enable th to follow the example of the Indian Tea Association, and hav shop where E. I. Coffee could be sold in the cup. In the even

the various Local Governments giving us sufficient support, he would appeal to all coffee owners and firms interested to subscribe liberally towards an object which promised to help so largely, the E. I. Coffee industry, by practically demonstrating its superior quality and mild flavour which would probably do more than anything else to increase the consumption of pure E. I. Coffee.

In the event of sufficient support not being forthcoming for both objects, the W. P. A. S. I. intended to confine its exhibits to a case containing samples of the products of each district. For this purpose the U. P. A. S. I. had alloted Rs.1,500, but further subscriptions would have to be asked for. At present nothing could be finally decided until it was known what support the various Governments would give, and it was known what the probable cost would be.

Reduction of Rates of Labor.—This matter was discussed and letter from Secretary, South Mysore Planters' Association, read, asking if Coorg would co-operate with Mysore in reducing rates Various opinions were expressed, but it was unanimously agreed that, unless the reduction was also agreed to by all the Southern Districts and carried out universally, that on account of the rise in the price of grain. and the largely increasing demand for labor in the new tea districts, it was not feasible to make any reduction at present. At the same time it was thought that reduction of Artizans' wages, reduction of advances, and increased contracts, were all economies which could well be carried out.

Coorg Land and Revenue Regulations.—Mr. C. M. Nunjappah brought forward several objections to portions of these rules, which were discussed, and on explanations being given by Mr. Meiklejohn were withdrawn. The new Local Fund cess was then discussed, and a letter from Government was read, showing the taxes which it was proposed to remit and giving statistics showing that Government did not gain by the alteration, but that the smaller holders gained to the disadvantage of the large owners, and that we should have the control of spending a certain amount of the money accruing therefrom ourselves. Proposed by Mr. Sprott, seconded by Mr. Ball, that the Honorary Secretary be asked to send a formal protest to Government as strongly worded as possible, pointing out that, whilst thanking Government for proposing to remit certain taxes, the imposition of the cess was inopportune in the present depressed state of the coffee industry, upon which the chief burden would fall, and praying Government to postpone making any changes at present.

That the attention of Government be drawn to the increase of cesses which is undesirable in the present depressed state of the country, which has been chiefly brought about by the failure in coffee prices.

We would also wish to point out to Government that Local Fund Boards seem to be a failure in other districts, that we are satisfied with things as they are, and strongly object to a Local Fund Board at all, especially as it is probable that such an innovation would mean increased taxation.

The meeting closed with a vote of thanks to the Chairman and to Mr. Meiklejohn for so kindly attending and explaining matters.

The following papers were laid upon the table:—

A pamphlet on Moopenaad Arabica Liberian Hybrid with photograph of same.

Minutes of meetings of the following Associations:—

Central Travancore, September 23rd, 1899.
Shevaroy, October 2nd, 1899.
Nelliampathy, October 16th, 1899.

MERCARA,
November 1st, 1899.

W. H. SPROTT,
President, C. P. A.

WYNAAD.

PROCEEDINGS OF GENERAL MEETING held at Meppaddi, on 8th November 1899. PRESENT.—Messrs. J. W. Hockin (*Chairman*), C. M. Behr, Dr. McCaully Hayes, R. Lamb, C. C. Lance, D. Mackenzie, W. Mackinlay, B. Malcolm, A. C. Glenie, M. D. Taylor, C. B. Winterbotham, A. E. DeFonblanque (*Honorary Secretary*).

Visitors.—Messrs. F. A. Wilkinson (Superintendent of Police), J. Bruce, A. Nelson and H. Walker.

Proceedings of last Meeting.—The proceedings of the last Meeting were taken as read.

Roads.—Mr. M. D. Taylor, Wynaad Member of the District Board, Calicut, gave an account of his visit to the last District Board Meeting, and stated that the ghaut road was in a shocking condition.

Post Office.—*Read* letter from the Postmaster-General consenting to Tappal bag being deposited at Pudupadi from Vayitri.

Resolved—

(1) That the Postmaster-General be thanked for granting the request of this Association, and that he be asked to send a bag from Calicut also.

(2) The Secretary was requested to ask the Postmaster-General for an answer to his letter of 18th August on the subject of the delivery of Money Orders, V. P Parcels and Registered Packets.

3. The Secretary was requested to write to the Postmaster-General asking for an explanation of the late delivery of Money Orders.

Coffee Robbery.—*Read* letter from the Superintendent of Police, Calicut, asking for information as to the best time to send up the extra constables to prevent the theft of coffee.

Resolved, that the Superintendent be thanked for the trouble he has taken in the matter, and that he be informed that the Association considers that the 1st November would be the best date on which to send up the constables.

Police.—*Resolved*, that the Superintendent of Police, Calicut, be requested to supply the European Chief Head Constable with horse allowance, as this would render him far more effective than he is at present.

U. P. A. S. I.—(1) *Paris Exhibition.*—A subscription list towards the Paris Exhibition Fund was circulated; the total amount collected came to Rs.645.

(2) The Secretary was requested to ask the Secretary, U. P. A. S. I., for a copy of the draft of the new labour ordinance; and the Committee were asked to meet to discuss it at the earliest opportunity.

Alleged Cooly-Crimping.—*Read* copy of letter from the Ceylon Labour Federation *re* alleged crimping from Ceylon.

Proposed by Mr. R. Lamb, seconded by Mr. M. D. Taylor, that this Association point out that it is not within its province to interfere in the matter referred to by the Secretary of the Ceylon Labour Association in his letter to the U. P. A. S. I., dated 13th September 1899.

A vote of thanks to the Chair closed the Proceedings.

(Signed) E. DEFONBLANQUE,
Honorary Secretary, W. P. A.

NELLIAMPATHY.

PROCEEDINGS OF A MEETING held at the Victoria Bungalow on the 13th November, 1899. PRESENT:—Messrs. H. M. Hall (*Chairman*), C. Hall, J. B. Burnett, P. W. E. Watts, J. C. Abbott, A. Barnes, G. H. Welchman, A. R. Jones, H. de C. Denny, W. L. Ranking and W. R M. McKenzie, *Honorary Secretary*.

Postal Improvements.—Read correspondence with the Circle Superintendent.

In future, mails will arrive at 8 A.M. instead of noon, and be despatched at 1-30 P.M.; and local letters as soon as received.

Recorded with satisfaction.

Local Magistrate.—Read letter from Dewan's Secretary, that the matter was being carefully considered and that the District Magistrate has been asked to report on the feasibility of the request.

Recorded with satisfaction.

Roads and Bridges.—Read letters to the Dewan and Chief Engineer on above subject, and Chief Engineer's reply with his proposals for handing over the District roads to the Association and a certain sum for maintenance.

It was resolved—that Mr. C. Hall undertakes the upkeep of all the roads from Nadaghunny upwards at the rate of one rupee per chain on the understanding that the same are given over to him in a fair state of order, and that the supervision of the work should be carried out departmentally, the Association declining to carry out any bridge or road work on the ghaut.

Coffee-stealing.—The Honorary Secretary was instructed to write to the Assistant Superintendent of Police, Palghat, to ask him to increase the Police force on the British Cochin boundary.

Medical.—The Honorary Secretary reported the receipt of a cheque in settlement of the account for erection of Medical quarters by the Association.

The meeting was brought to an agreeable conclusion by the presentation of a sterling silver centre-piece from the members of the Association, both resident and absent, to Mr. J. C Abbott, in recognition of his long and valued services as Honorary Secretary.

(Signed) H. M. HALL,
Chairman.
(„) W. R. M. McKENZIE,
Honorary Secretary.

THE BIG PRIZE TURKEY.

"A Merry Christmas, Bob," said Scrooge, with an earnestness that could not be mistaken, as he clapped him on the back. "A merrier Christmas, my good fellow, than I have given you for many a year. I'll raise your salary, and we will discuss your affairs this afternoon over a bowl of smoking bishop. Make up the fires and buy another coal scuttle, Bob Cratchit."

And as to the big prize turkey which the regenerated Scrooge sent to Camden Town, do we not all know what sort of bird it was? That turkey never could have stood upon its legs, Mr. Dickens says. They must have snapped short off like sticks of sealing wax. How they managed to cook and eat that phenomenon the author dosen't say, as it was twice the size of Tiny Tim. Yet they did it somehow, and it was a mercy if the family (previously half starved) didn't all fall ill of the unwonted gorging of that wonderful Christmas day.

Even assuming (as we easily may) that the transmutation of an old skinflint like Scrooge into a high priest of charity was quite beyond the common run of modern miracles, and that dinners from such sources are as rare as they are welcome, it still remains true that human nature is apt to be at its best at Christmas, especially in England, where, of all countries in Christendom, most is made of that gentle and kindly holiday.

Yet, sad to tell, the very jollity and generosity of Christmas leads to regretable excesses. People eat and drink too much, and suffer accordingly. The roast and the boiled, the mince pies, the plum puddings, the tremendous flushings of wine, beer, and other beverages, these things overload the stomach and give the digestion more work than it can do, and punishment follows. For Nature has no favourites; she treats those who violate her laws on the 25th December exactly as though they had committed the offence on the first Monday in August.

And as to the chronic dyspeptics, of whom there are enough in this old island to cram all the parks in London, *they* catch it fearfully about Christmastime. For, in spite of all warnings, they *will* go in for heavy meals and take the chances. Often the penalty is an acute attack which may threaten life, and nearly always weeks of pain and digestive disorders, whereof there are as many kinds as the body has organs and functions.

To them Christmas may be "merry" for an hour or two; then their merriment turns into misery, as October fogs and rains succeed a hot summer.

Now the writer is far from advising a free indulgence in the gustatory and bibulous festivities of the country's most popular holiday, but there is no use protesting against the fixed resolution of the people to enjoy themselves on that occasion. The customs and traditions of centuries are behind it, and you might as well whistle in the teeth of a north-east gale.

As a prophylactic and a cure for the evils alluded to, I can only recommend the universal use of Mother Seigel's Syrup, known to all as the best stimulant and digestant in the world.

In a letter dated January 10, 1899, a gentleman of Birmingham, who loves the pleasures of the table, and has money enough to buy whatever he wants, writes thus: It is only fair that I should thank you, as I do with all my heart, for the good done me by Mother Seigel's Syrup For years I have been vexed with indigestion, and always had a tormenting spell of it after any public banquet or uncommon intake of rich food. Still, I was seldom able to resist temptation, although I understood perfectly well what yielding to it was sure to cost me. I have sought a preventive or a cure in vain at the hands of the best physicians, all of whom assured me that there was but one way, namely, to live on a low diet, and let luxuries alone.

"But this did not suit me, and I broke through the regulations frequently, with the inevitable results However, when I began to use Mother Seigel's Syrup I had (almost) a license to do as I pleased. After an inviting but most risky dinner last Christmas I took a double dose of 'Mother Seigel,' and scarcely suffered at I told my experience, and a dozen friends adopted this amaz remedy right off. I am convinced that, with a little caution, a dose of Mother Seigel's Syrup now and then, *one may bid defi to dyspepsia* and the abominable ailments it sets up. Thank you a thousand times. I am, yours truly, JOHN MACFARLANE."

With these facts we wish a merry (and a *healthy*) Christma the British people.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colo Markets for the Week ending November 1st, 1899, says:—

This market has been firm throughout the past week, an greater portion of the supplies catalogued have been sold general advance of 1s to 2s per cwt. East India met with a demand, the bulk changing hands at fully this advance. B markets continue firm.

Daily receipts averaged 12.000 bags in Rio, and 22,000 bag Santos.

Futures close firm at about unchanged to 3d per cwt. dea viz.:—Good average Santos in Havre, December delivery, 35.25. in Hamburg pf. 29½, and No. 7 low ordinary Rio in York $5·20.

To-day's London official quotations are:—

TEA.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 3rd, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	654,441	528,725	25,811
1898-1899	684,872	531,864	19,912

9,114 *pkgs.* INDIAN
3,123 „ CEYLON
— „ JAVA

Total 72,237 packages were offered in public auction this week.

Figures indicate a healthy condition in the Indian and Ceylon Tea trade, the satisfactory October deliveries having brought clearances from 1st June up to 98,364,316 lbs, against 96,121,979 lbs. during the same period last year. The strongest features are the small increase in the stock of Indian Tea in spite of much larger arrivals and the fact that Indian imports compare with the period of last season, when there was a shortage from Cachar and Sylhet.

INDIAN.—49,114 packages were brought forward against 47,152 last week. Auctions passed with a general and fairly active demand specially noticeable in Teas up to 7½d. per lb. which advanced about ¼d. per lb. on last week's rates. The official wire gives exports to U. K. for second half of October as 13,400,000 lbs., against 10,820,000 lbs., and the total from 1st April to end of October 96,592,000 lbs., against 91,037,000 lbs. in 1898. The following averages are worthy of note:—"Rungmook," 1/6¾, and Assam Co. "Gabroo Purbot," 1/2.

Week's av. of Tea sold on Garden Account 1899, 38,816 pkgs., av. 8·84d. 1898, 37,267 pkgs., av. 8·35d.

Total Tea sold on Garden Account 1st June to date 1899, 464,854 pkgs., av. 8·58d. 1898, 444,723 pkgs., av. 8·68d.

CEYLON.—The auction was again fairly small, 23,123 packages being brought forward, against 22,446 last week. Bidding for all grades was strong, and prices distinctly firm with a rise in medium and lower grade Teas of about ¼d. per lb. The official telegram gives exports to U.K. for October as 7,500,000 lbs., against 6,500,000 lbs., making the quantity from 1st January to end of October 84,750,000 lbs., against 81,000,000 lbs. in 1898. The following averages may be mentioned:—"Craig" and "Nuwara Eliya T Co. Concordia," 1/0¼; "Loinorn" and "S T Co. St. Leonards," 11¾d.

Average for week 8·43d., against 8·41d. in 1898.

Ceylon Tea sold on Garden Account 1st January to date 1899, 910,094 pkgs., av. 7·97d. 1898, 960,782 pkgs., av. 7·71d.

JAVA.—No Javas were brought forward this week, but catalogues are issued for 2,240 packages.

CINCHONA.

The Vriesseviem cinchona bark department at Amsterdam reports that the shipments from Java from September 26 to October 30, 1899, amounted to 1,383,000 Amst. lbs., and from January 1 to October 30, 9,155,403 Amst. lbs. At the sales on Thursday there is likely to be heavy buying by German manufacturers, and an advance in the unit is anticipated. The Ceylon shipments from January 1 to October 10 have been :—

	1899.	1898.	1897.	1896.
Lbs.	534,640	749,988	599,346	887,094

The Nederl. Veem cinchona-bark department here reports the shipments from Java during October, 1899, amounted to 959,000 Amsterdam lbs., against 1898, 969,000 Amsterdam lbs.; 1897, 735,000 Amsterdam lbs.; 1896, 862,000 Amsterdam lbs.; 1895, 1,100,000 Amsterdam lbs.; 1894, 952,000 Amsterdam lbs.; 1893, 349,000 Amsterdam lbs. Total shipments, January-Oct.:—1899, 9,421,800 Amsterdam lbs.; 1898, 8,895,000 Amsterdam lbs.; 1897, 6,717,000 Amsterdam lbs.; 1896, 8,280,000 Amsterdam lbs.; 1895, 6,929,700 Amsterdam lbs.; 1894, 7,577,000 Amsterdam lbs.; 1893, 6,225,000 Amsterdam lbs. At the auctions held at Amsterdam on 2nd instant, 6,141 packages bark were offered (against 7,510 in September), of which 5,120 were sold at an average unit of 6·80c. per half-kilo., as compared with 5·35c. in August. The following were the approximate quantities purchased by the principal buyers :—American and English factories, who purchased the equivalent of 11,911 kilos.; Brunswick, 1,952 kilos.; the Mannheim and Amsterdam factories, 2,182 kilos.; the Frankfort-on-Maine and Stuttgart factories, 4,659 kilos.; and various buyers, 3,279 kilos. The prices paid for the manufacturing-bark ranged from 13¼c. to 71¾c. per half-kilo., and for druggists, up to 93¼c. per half-kilo. The tone of the market was very firm.

QUININE.

The second-hand market has remained quiet throughout the week, although December delivery has advanced ¼d and March ½d per oz. since our last report, there being sellers on Tuesday at 1s 1⅓d for December and 1s 2d per oz. for March delivery. To-day, however, the market has assumed a firmer tendency, owing to the advance at the Amsterdam bark-sales, business being done at 1s 2d for December delivery, and March at 1s 2⅓d to 1s 2½d per oz. Makers contemplate an advance.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-early, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," Agra Bank Buildings, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 8th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

COFFEE AND EXCHANGE IN BRAZIL.

Although there is, as is but natural, considerable conflict of opinion as to the prospects of Coffee, there is also a very general agreement among various authorities as to several of the chief points that have to be considered. Messrs. W. H. Crossman & Brother, of New York, in a letter we published last week, stated one view of the case. The *Brazilian Review*, from which we quoted at the same time, expressed much the same opinion in some respects. What we may term "an official view" that has now come under our notice, follows in part the same lines as taken by the above two authorities. We refer to remarks made in the preamble to the latest report of the Minister of Finance, Dr. Joaquim Murtinho, to the President of the Brazilian Republic. Without asserting that a Minister of Finance must always take a correct view of the chief problem that he has to solve, we may at least say that his opinions are entitled to respect, and when they concur with those of lay experts, we may reasonably assume that they come very near the truth.

Now, Dr. Murtinho states that the present economical crisis in Brazil originates "not in the decrease of the volume of production but in that of the value of its most important element—coffee." This shrinkage, he says, is the economic,

logical and inevitable consequence of over-production. As he puts it, the crisis is the expression of "an economic debasement consequent on a vicious application of energy to the production of a single commodity in excess of the market's requirements." He asserts that just as there is in Brazil superabundance of paper-money in relation to its value, so there is superabundance of coffee in relation to consumption. Consequent upon this, there is depreciation in the value of both currency and coffee. He alludes to a pseudo-abundance of capital as having brought about the organisation of the coffee industry on an exaggerated basis. Dr. MURTINHO regards coffee as a natural industry in Brazil, yet holds that it has become in part artificial as a result of over-production that has "disequilibrated" demand and supply, and caused a fall of prices. In no other country can this article be produced so economically, yet the net product of the industry has almost ceased to remunerate capital at all. He throws the blame for this, partly upon the cultivation of poor land with unsuitable climate and without sufficient capital. Again drawing a parallel between coffee and currency, he remarks :—"Armed with an enormous stock the shipper does not require to buy for a long time to come and imposes what price he pleases which the producer, unable to resist, is obliged to accept. Armed with an enormous stock of paper-money the dealer in exchange has no necessity of acquiring paper-money for payment of exports for a long time and consequently is able to impose whatever price he pleases on the seller, that is, on the importer who is unable to resist, being obliged to punctually meet engagements, abroad. Prices of both coffee and paper-money fell here below what they should, in consequence of the superabundance of one and the other. Prices, consequently, actually represent not only the effect of the over-production of both but of the fatal influence of speculation as well." In short, the Brazilian Minister of Finance holds it as certain that there is a lack of equilibrium between supply and demand.

There may, therefore, be two solutions : (1) the increase of consumption ; (2) the decrease of production. As to the former, we are told that there are two agencies by which consumption may be stimulated : by popularising the excellent qualities of coffee amongst those unaccustomed to its use, and by the reduction of the import duties in some countries where they are practically prohibitive, and neutralise the effect of the fall of prices upon consumption. As to the former course, we may remark that Messrs CROSSMAN do not appear to think that there is much hope for planters in this direction. Dr. MURTINHO also comes to much the same conclusion as that expressed lately by the *Brazilian Review*, namely, that the evil is one that must work itself out, on the lines of natural selection and the survival of the fittest. As regards the currency also he points to two solutions : the increase of value of exports, or reduction of the volume of paper-money, seeing that the quotient may be raised equally by increasing the dividend as by reducing the divisor. The first he regards as of so tardy a realization as to be unsuited for the solution of a problem so urgent, and thus he in a manner justifies the selection by Government of the only alternative—the reduction of the volume of the currency. But he dwells on the dangers of haste. Briefly put, his aim would appear to be to encourage the fit and discourage the unfit as regards coffee, and to reduce an unhealthily bloated currency to proportions more favourable to health and strength. How far he hopes for success in this latter direction is not clearly shown, but he alludes to the results as "distant but certain." Messrs. W. H. CROSSMAN & BROTHER, it will be noted, take the same view as to coffee, but hold that "it is too much to expect that Brazilian finances can be improved sufficiently to double up the present sterling rate for the milreis." There is not very much encouragement for Indian coffee-planters in either view ; but a careful study of the weighty opinions here noticed confirms us in the belief that the Indian planter will do well to rely but little upon hopes of reduction of Brazilian production and to steadfastly aim at reduction of cost to a minimum and improvement of quality, while lending active aid to every effort that has for its object the development of consumption.

ROSES AND POTS.

We have received from Messrs. Curtis, Sanford & Co , Ld. of the Devon Rosery, Torquay, some most attractive lists of plants, seeds, &c., and would call special attention to a very interesting "descriptive catalogue of selected roses, with directions for culture." This is an illustrated list and forms a very handy little guide to the amateur gardener. From the catalogue of trees, shrubs, &c., issued by the above concern, it is evident that the Rosery by no means confines itself to roses. There are many plants offered which, while plentiful enough in tropical countries, are varieties in England, and with the immense assortment they offer, Messrs. Curtis Sanford & Co. must have a very attractive place to show to visitors.

A price list of *steel* flower-pots is also issued. To those who have experienced loss and damage to earthen pots especially after heavy rain, steel pots should appeal. We are told that the small sizes cost more (in England) than the corresponding sizes of earthen pots, but that in the case of large sizes the steel pots gain an advantage of as much as 25% in cost. Considering that they do not break, and are easily conveyed from place to place without damage, this should cause the large sizes, at least, to come into demand. If the small ones were to work out at only a little advance upon the cost of earthen pots, we fancy most gardeners would prefer them, for it frequently happens that great injury is done to valuable nurselings through the fracture or "collapse" of an earthen pot. The steel ones, by the way, are lighter than the earthen.

BOARD OF TRADE RETURNS.

OCTOBER 1891.

The following tables show the Imports, Consumption, and Exports of the undermentioned articles for the ten months ending 31st October in the present and two previous years, compiled from the Board of Trade Returns, with stock in U. K. on the 31st October.

Coffee.—It will be seen that Imports have increased very largely, while Home Consumption shows steady expansion which has been gaining speed. Exports also have increased considerably ; but, unfortunately, so have stocks, which are now more than double what they were in 1897.

	1897. Cwts.	1898. Cwts.	1899. Cwts.
Import	681,076	870,920	942,171
Home Consumption	208,167	212,422	222,518
Export	394,408	467,758	545,777
Stock	225,000	391,000	480,000

Cocoa.—The rivalry of Cocoa with Coffee and Tea becomes yearly more formidable. It will be seen that English-prepared Cocoa is gaining ground and that foreign preparations are losing. The total consumption of Cocoa continues to increase, however, and the statistical position of the article is distinctly strong.

Raw.	1897. Lbs.	1898. Lbs.	1899. Lbs.
Imported	31,131,897	37,705,634	40,076,127
Home Consumption	23,660,572	25,956,288	29,246,086
Export	12,178,019	8,802,404	9,646,849
Stock	19,255,000	17,722,000	16,846,000
Prepared.	1897. Lbs.	1898. Lbs.	1899. Lbs.
Imported	7,177,087	6,771,938	4,160,864
Home Consumption	6,470,022	5,365,071	4,458,874
Export	434,088	571,209	639,032
Stock	356,000	1,224,000	387,000

Tea.—Steady, healthy growth characterises the Home trades, and the shrinkage in exports may be explained by the increase of direct shipments from Calcutta and Colombo to European ports outside the U. K.

	1897. Lbs.	1898. Lbs.	1899. Lbs.
Import	207,490,615	212,056,780	224,377,839
Home Consumption	193,095,301	194,700,298	201,716,686
Export	30,378,178	30,284,589	26,571,000
Stock	85,830,000	85,848,000	94,807,000

We would especially draw our readers' attention to returns of stock. The figures given above show the following approximate result :—

	Months' supply for Home trade in stock.
Coffee	23
Cocoa	5
Tea	4½

Or, taking Export trade into consideration as well as Home consumption, we get the following :—

	Months' supply.
Coffee	6
Cocoa	4
Tea	4

From every point of view the position of coffee is the weakest.

GREEN MANURING IN QUEENSLAND.

Mr. P. McLean, Under Secretary for Agriculture in Queensland, said some little time ago that the subject of green manuring was one of the deepest interest to those engaged in the sugar industry ; also that a very heavy order had been placed with his department for a supply of cow-peas. It was, he said, a question that deserved every consideration, not only at the hands of those engaged in growing the cow-pea for manuring, but also for the general farmer. With reference to this, Mr. William Gibson, of Bingera, remarked that the benefits likely to be derived from cow-peas were no longer a matter of experiment. We are convinced, he observed, of the efficacy of cow-pea in its increasing the fertility of the soil. "As all who are interested in the cultivation of the soil are aware, there are patches of ground each year that require to be fallowed, and they also know that some change of crop requires to be put into the ground. Our experience teaches us that, in fallowing the land for the ground to be benefited, it is necessary that the soil should be covered from the rays of the sun with some crop, even if it is only grass, but more frequently with something in the form of cow-pea to add to the nitrogen that has been taken from the soil by some previous crop. Cow-pea gives us better results by a little addition to the soil of superphosphate, previous to the planting of the cane, and, with the facts at present before us, we are determined to continue with the cow-pea, with the addition of the superphosphate, before planting the cane, wherever practicable." He added that he was quite convinced that the cow-pea was of benefit, not only for its nitrogen, but the shading it gives the soil, and that it was one of the cheapest and safest ways of re-couping the soil from the effects of previous crops. A gentleman from the Mackay district expressed his concurrence in these views and said that the cow-pea both acts as a manure and cleans the land. "As for the manuring of cow-pea, of course, it does not require a nitrogenous manure. It seems to require potash especially. A small experiment that we are carrying out proves that the application of one hundredweight of kainit to two hundredweights of bone-meal increases the yield of cow-pea 25 per cent. Bone-meal gave a better return on unmanured land ; but, of course, my experiments are by no means conclusive. A neighbour of mine has asked me to bring up the question of the difference in the quantity of nodules on the roots of the cow-pea in different classes of soil, and whether it makes any difference in the nitrogenous value of the cow-pea if the nodules are absent."

Mr. J. C. Brunnich, Agricultural Chemist, gave a hint that seems worthy of the attention of experimentalists in leguminous manuring in Southern India :—"It is little use thinking that if land is worn out cow-pea will re-coup it, and Gibson's remarks show this to be the case. I know for a fact that the land Mr. Gibson refers to is particularly poor in phosphoric acid and nitrogen. Cow-pea will supply one deficiency ; but, to get proper results, he adds superphosphate to it. This shows that you must apply the other manure to secure the best effect from the cow-pea. Mr. Swayne, on the other hand, advocates potash along with cow-peas. Well, I know the land about here is poor in potash, and this shows that a grower must use his judgment in the selection of another manure to derive the full benefit from cow-pea. It will be very injudicious for a farmer to pin his faith on cow-pea alone. Cow-pea in this district may be good ; but in other districts other plants may do better." Our readers will, in fact, probably find that much of what we have here quoted, with reference to cow-pea, applies almost as forcibly to such plants as *Erythrina lithosperma*.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

XXI.

Sun withering—is very objectionable as has been already hinted. The effect is somewhat similar to that of preserving the color in ferns and leaves by ironing them with a hot-iron. In the manufacture of green tea, the fresh plucked leaves are put at once on to a hot-pan and tossed till withered, the green color thus becoming fixed or, in other words, the power of the leaf to absorb oxygen destroyed. Such is the result, in a lesser degree, attained by withering in a sharp sun. In cloudy, steamy weather, however (under such conditions as cause fallen green leaves to turn yellow instead of green), very good results can be obtained and flavoury tea made. These differences will be well understood by those who have studied hay-making. Probably the differences of opinion upon this point are due to the separate results that are obtained

under varying climatic conditions. Roll as you may; use whatever arts known upon leaf withered in a sharp sun, you will fail to get more than a blackish-greenish color.

A damp warm room—gives a splendid wither that will color very quickly, such conditions in fact under which fruits are ripened best. We have had here in 1881—89 such a room, from which very good results were obtained in the hot weather. One wall was a mud bank from which in the rains springs would start! Wonderfully fine teas came from that room, and we mourn the loss of it now. Our readers who have opportunities of making this experiment should do so and let the planters have the benefit of the result. We would here draw attention to the difference between a plantain slowly ripened in a room with a temperature of 70°, and one forced in an hermetically-sealed earthen pot into which smoke is blown, Indian fashion! Those not acquainted with this difference should make trial of it. The object aimed at for a good wither should be to

Ripen the leaf.—Very little is then needed to secure a good color, in fact the roll is almost ready for the drier at the end of an hour's good rolling. There is small doubt in our minds that this withering is a great puzzle to every planter and that he is at times inclined to tear the hair off his head with vexation, when he sees the negative results obtained from a number of fine jims! All the light then that can be shed on the subject by old planters should be unsparingly turned on. We know that on some days beautiful tea is made without an effort, nature (climate?) seeming to do all the work, while, on other days, strive how we may, poor tea is made. Many have tried to artificially produce the climatic conditions of Darjeeling to secure the flavor and liquor of the premier district, and their efforts, in this direction, are no doubt correct, as to make butter one has to lower the temperature of cream on the hot plains of India, and to make good cheese we need the climate of the temperate zones!

Pruned Leaf—with thick succulent stalks is very difficult to wither, unless the conditions be such as to ensure a slow process Ordinarily it is useless waiting until the stalks will not snap, as the leaves will then become over-withered. A remedy can be found by plucking only leaf and bud for two months after a low prune, thus securing better bushes and finer tea.

A well withered leaf—will feel soft and glove-like. A handful rolled into a ball can be tossed a dozen times before separation takes place. There should not be a single black leaf, if possible, or, in any case, not more than one here and there, such as is unavoidable under all existing arrangements. The loss is about 30 per cent. It is better far to under than to over-wither. A good withered leaf will exude a thickish juice, that does not run, when being rolled. An over-withered leat will show little or no moisture in the roll. An under-withered leaf will show a large amount of thin watery sap that runs all over and under the rolling table. These conditions vary somewhat with the time of the year and the weather, and allowances must be made. There is little sap present in the hybernating period—August-September, and in the coldest months January-February. There is a good deal of sap in laughing April, more in gushing May, also in the months of September, October and November. Sometimes September is a very dry month. Mr. Bamber, on page 219 of his most excellent work, writes:—"When the leaf is from "high-class bushes, it withers more easily than leaf fro "poor hybrid or China bushes owing to the softer texture "the epidermis of the leaf." Our experience is diametrical opposite, and we have invariably to spread Assam jât le thinner than we do China, the reason being that the highe jât has much more moisture in it. We do not think that th

Mesh of the cloth—or netting used for withering, count for much, and consider that the withering takes place mor by air that passes *over*, than what passes *through* the tat This can be easily tested by the use of a bamboo or othe mat over any section and noting whether leaf on the mat i less withered than that on the cloth or netting.

NOTES.

Mild Coffees. We publish a very interestin paper about the Mild Coffee Trade (i the United States). It is significant to note how brief i the allusion therein to East India Coffee formerly "the grea mild coffee."

Calcutta Tea Sales. The average price realised at th sales on 17th ultimo was 5as. 10p Last week 17,222 packages were sold; a flat tone prevailed throughout the sale and, excepting for common teas, price were a quarter to half anna lower, common to medium broke pekoes being exceptionally difficult of sale.

The London Tea Market. Cabling to Colombo on the 23r ultimo, Messrs. Gow, Wilson an Stanton reported that heavy supplies of Indian Tea wer depressing the market. Medium liquoring and broken pekoe showed a slight decline, and the market was easier for tea for prices. The average of Ceylons had dropped ¼d. an stood at 7⅞d. Of 26,000 packages Ceylons offered, 22,00 were sold.

Colombo Tea Sales. At the Colombo sales on 22nd ult about 12,521 pkgs. = 989,112 lbs were offered, of which about 8,700 pkgs = 690,032 lbs were sold. The *Times of Ceylon* remarks:—A great disincli nation to operate was noticeable at the auctions, and price generally for all except common teas were decidedly weaker Broken Pekoes were almost entirely neglected. Good medium were offered from St. Johns, Mocha, Ben Nevis Tonacombe Palmerston, Hatton, Kelaniya, and Bræmar.

Adulterated Tea, Coffee, &c., in the U. K. According to the report of the Local Government Board, of 1,87 samples of coffee examined during the year, 187 were found to be adulterated. Of Tea, 486 sam ples were examined and only 15 found to be adulterated. W confess to a doubt as to the reliability of the examinations however, for the figures concerning pepper show only 1 "adulterated out of 1,566" examined. Our impression is tha the adulteration of pepper is by no means so rare as figure such as these would lead people to suppose.

The London Coffee Market. Commenting on the slightly firme tendency recently noticeable in th London Coffee Market, Messrs. Enri que Cortes and Co. attribute it to (1) reports that the plagu had reached Brazil: (2) discontent among labourers (chiefly

Italians); (3) increased deliveries; (4) smaller arrivals at Brazilian ports of shipments; (5) diminution of production in India, Java, Central America and the Antilles, especially in Puerto Rico, in consequence of the violent hurricanes of August last, which have done damage to many plantations.

Cocoa in Trinidad.

According to the Annual Report of the Acting Governor of Trinadad, the area of land under Cocoa in the island is estimated to be 103,000 acres which, in the year 1828, gave a crop of 24,340,306 lbs. This will be considerably exceeded in 1899. Cocoa is exported in bags averaging 165 lbs. each. The cost of cultivation varies from 33s. to 60s. per bag; but 40s. may be taken as an average for a fairly matured estate. The average price obtained last year was 80s. per bag, so 40s. may be taken as the average profit per bag. The value of an estate to produce 600 bags is about 60,000 dols., or £12,500.

Bug or no Bug?

The *British Central African Times* is taking quite particular pains to demonstrate that a ladybird is one thing, a bug another. Our contemporary brings its Encyclopædia to the front, and all with the object of proving that "the spotted bug" that brings about spoiled coffee bean is a bug, not a beetle. The Kew authorities have also been asked to report upon the insect. Mr. Kenneth Cameron thinks, by the way, that the bug remains in an active state from one year's end to the other, and that only a severe drought with no fruit would kill it out unless picked off.

Russian Tea Buyers in Colombo.

It is reported that Messrs. Stcherbatchoff, Tchokoff & Co., and Messrs. Tokmakoff, Molotkoff & Co., of Colombo, in the interests of other Ceylon merchants doing business in tea with Russia, and after conferring with them, are calling a meeting at an early date to consider what steps should be taken to enlarge the scope of their business with Russia. Russian buyers complain of the small amount put on the local market, and urge its increase. Both the Russian and English tea merchants of Colombo doing business with Russia are to consider the subject in all its aspects at the forthcoming meeting.

Seychelles Vanilla-crop.

A Seychelles correspondent, writing on September 25, states that the prospects for the 1900 vanilla-crop are gradually becoming worse and worse. There is not, at the present time, the slightest appearance of any flowering, and we are now at the end of September. Planters are naturally growing gloomier every day. Prices of old-crop are very firmly maintained, as much as 18r. per half-kilo. having been paid for really fine pod. These high prices are partly due to large buying-orders having been received from Germany. The exports for 1898 were 15,344 kilos. to the United Kingdom (460,320r.), and to France 9,044 kilos. (271,320r.). The total amount recorded was 25,177 kilos.

Coffee Adulteration.

Coffee suffers in the matter of adulteration as compared with tea, says the *Home and Colonial Mail*; the berry seems to offer to the manipulator the chance he yearns for. Mixing chicory with coffee being to some extent a played out form of adulteration, a grocer in Cheshire has been coating the berry with sugar, hereby increasing the weight of the coffee from 5 per cent. to 10 per cent., and obtaining a shilling a pound for what in the ordinary way would not fetch much more than a twelfth of that sum. Even the berry is being imitated by a treatment of maize. The fraud, which is made in Germany, has found its way into Yorkshire, and, according to the Government analyst, it is most difficult, even on close inspection, to distinguish the doctored maize from the genuine coffee berry.

A View of Coffee in Hawaii.

Among the inducements held out to attract settlers from the United States to its new island possession, Hawaii, is the adaptability of the climate and soil of the island to the cultivation of the coffee bean. Says the Philadelphia *Times* on the subject: "It is asserted that all the prospective settler with a small capital would have to do would be to acquire a tract of land, plant it with young coffee trees and wait for the same to grow to maturity. It seems to be assumed that the demand for coffee is unlimited. Probably no form of cultivation in the tropics has been overdone to the same extent as coffee planting. With Rio standard No. 7 at 6 cents and a fraction per pound, and the Brazilian, Central American and East Indian plantations glutted with their unsold products in spite of the low price, it would seem as though the supply had far overgrown every possible demand."

The Acme Tea Chest Co., Ld.

At the Annual Meeting of this Company held on October 10th, the Chairman stated that the price of the raw material for steel chests had gone up 50 per cent. He was sorry that he could not declare a devidend on the ordinary shares, but the usual six per cent. on the preference shares would be paid at once. The new Veneer Chest had turned out a great success and the factory was working day and night to get orders out and the present output would soon be doubled. It had cost them a great deal of money, but with a first-class plant and a forest growing their own material, sufficient to last them for the next twenty years, their prospects for the coming year were very promising. They were now turning out a magnificent chest in the "Veneer Acme" and the combined orders for Steel and Veneer Chests were expected to reach over half a million this season.

Sir Thomas in a new light.

The *Critic* gives quite a new suggestion in regard to Sir Thomas Lipton's attempt to win the American Cup. It remarks:—"Many experts here believe that America is destined to be one of the great rivals of China and Ceylon in the production of tea. I need hardly add that 'here' is New York; and my readers will possibly ask whether there is any single thing for which those States are not 'destined.' The foundation of this new faith is the reported success of a 50 acre experiment in America tea-growing. 'The product has all the flavour of the choicer Oriental brands,' which is what one would expect. No doubt Sir T. Lipton's trip to America was only in name connected with the yacht race. He really went to make an offer for the Summerfield crop and to pick up a hint or two from the Yankees likely to serve the ends of his Ceylon agents no doubt; but if he visited Summerfield, Sir Thomas kept his movements very dark."

Cinchona in Ceylon.

In the course of an address before the Royal Colonial Institute on the 7th instant on "Ceylon," Mr. John Ferguson, of Colombo,

said the brief record of cinchona-planting in the island was full of romantic interest. At first planters scorned the idea of cultivating a medicinal plant, but when coffee failed there commenced a rush into cinchona all over the hill country, and proprietors thought they were on the road to fortune; but an export of little more than a million pounds in 1880, when quinine was 12*s.* per oz., was followed in 1884 and following years by twelve, thirteen, and fifteen million pounds, and the quinine value came tumbling down to 1*s.* 3*d.* per oz, at which rate it did not pay to harvest the bark in Ceylon. Lately there had been some revival in price, and the export being very low—less than a million pounds last year—it was thought cultivation might prove profitable if judiciously carried out in favourable districts.

The Spanish Customs.

The following royal decree was published in the *Spanish Official Gazette* of 1st April last:—In conformity with the proposal of the Minister of Finance, &c. In the name of my son. King Alfonso XIII., and as Queen Regent of the Kingdom, I decree as follows:—Article 1.—Cocoa and Coffee in berry are declared to be included under numbers 308 and 310 respectively of the Customs Tariff in force, when they arrive toasted or in any other form than in their natural state. Article 2.—The explanation contained in the preceding article will be understood to apply to all assessments made in the Customs Houses of the Peninsula and Balearic Islands, from the publication of this decree in the *Madrid Gazette*. Article 3.—The Minister of Finance will dictate orders for the fulfilment of this decree and will account for it to the Cortes for their approval. (Signed) MARIA CRISTINA, and RAIMUNDO F. VILLAVERDE,
MADRID, March 29. Minister of Finance.

Queensland Coffee.

The *Cairns Argus* writes:—Our representative in passing took a look in at Mr. R. D. Lewis' coffee manufacturing establishment in Lake-street yesterday, and found that gentleman as usual busy with various matters, such as the roasting and grinding of coffee beans. He informed us that the whole of his crop for this season had been gathered in, and had amounted to 8 or 9 tons, procured from 10 acres of ground. Next season he expects to have a much larger output, as there will probably be about 20 acres of land producing coffee in consequence of many of the young trees beginning to bear. Mr. Lewis is of opinion that there will shortly be a rise in the price of coffee in the market. The rates at present prevailing in the Brisbane market were, he said, about 7d. a lb. for coffee in parchment, from 9d. to 10d. for cleaned coffee imported, and 1s. 10d. a lb. for pure coffee. Mr. Lew's desires to announce that he is now supplying pure coffee in tins in addition to the coffee and chicory which some people prefer. In this manner he is prepared to meet the tastes of all classes of persons.

The Trade of China.

At the London Chamber of Commerce, recently, Mr. C. T. Gardner, British Consul of Amoy, read a paper on "The Trade in China," in the course of which he said they could only hope for a perfectly satisfactory trade with China when the following events should have come to pass:—(1) The abolition of likin; (2) the abolition of the salt monopoly; (3) the abolition of the prohibition against the export of grain; (4) reforms in the administration of the country; and (5) the opening of the country to British capital and energy by permitting British subjects to obtain railway and mining concessions, to engage in manufactures, and lease agricultural lands in the interior. Climatic and soil conditions were as favourable in China as in any part of the world for the raising of tea, sugar, tobacco, coffee, quinine, and camphor. As to tea, in the Amoy consular district likin had utterly killed the tea industry, which a few years ago was worth millions a year. The tea gardens had run to ruin, and no other crop had taken its place.

The Madras Government Botanist.

In its report on the operations of the Department of Land Records and Agriculture for 1898-99, the Board of Revenue observes:—The post of the Government Botanist which had remained vacant for some years, was revived during the latter part of the year by the appointment of Mr. C. A. Barber to the post. His term of office in this Presidency has been sanctioned for five years, after which his services are to be made available elsewhere in India. The chief aim of his work is to make a systematic survey of the flora of the Presidency, although his advice will be available on subjects connected with economic botany. To assist him a small staff has been sanctioned, and his head-quarters have been fixed at Ootacamund, to which place the herbarium has been transferred. Before the close of the year, a tentative programme for the survey, under which the Government Botanist will spend three periods of about two or three months each during the year on tour, has been drawn up and approved; but until the close of the year Mr. Barber was chiefly engaged at Madras in arranging for the transfer of the herbarium to Ootacamund and only commenced field work later on.

Brazilian Exchange.

Writing on 17th October, the *Brazilian Review* says:—"Altogether, we maintain our opinion that the market is ripe for the turn and that, even should operators succeed in putting rates down again for a time, it cannot last . . . Another sign that the liquidation of the late bull deal has been rapidly proceeded with, if not completed, is the simultaneous shrinkage of cash balances at the Rio, Santos and S. Paulo branches of the five foreign banks by over 10,000 contos and that of their aggregate debit to head office and branches by over 15,000 contos, which are now almost the same as on 30th June last. Shipments of coffee, too, continue well over the average being £388,259 for the week as against the weekly average of only £331,942 since 1st July and £299,06- for the corresponding period last year." But the very same evening our contemporary had to add this little paragraph —"*The Bubonic Pest.* Reports were current that cases of pest had been observed at Santos. In consequence exchange was very weak, and after opening at 7s. 13/32d. dropped to 7s. 5/16d. at which it closed in spite of official and private contradiction of the rumour."

Experimental Farms for Madras.

A scheme prepared by Mr. Benson the Deputy Director of Agriculture has been recommended to Government for acceptance, which is, briefly, that, as a scheme to be ultimately worked up to, eight experimental farms should be established—four in the northern and four in the southern half of the Presidency—each farm to be about 50 acres in area: the general programme of operations on the farms being that suggested by the Deputy Director. In connection

with each farm, a school or class should be established by the Educational Department. The agricultural staff required at each farm will be a resident Inspector who might be designated farm superintendent, and one or more probationers attached to do duty as bailiffs and record-keepers in connection with the experimental work. As a programme for immediate operations, it has been suggested that very early steps should, if funds can be provided, be taken to establish two experimental farms—one in the northern and the other in the southern half of the Presidency. Passing orders on this the Madras Government observes :—"Schemes were elaborated during the year for the constitution of a Land Records staff and for expanding the operations of the Agricultural Branch of the department, in particular by establishing experimental farms. These schemes present many difficulties, but the Government hopes that it will be possible to make material progress towards their solution in the course of the current year. In the meantime, the present organisation of the department necessarily limits its operations in great measure to the collection of statistics and to isolated special investigations."

LETTERS TO THE EDITOR.

COFFEE PRODUCTION IN BRAZIL.

Messrs. W. H. Crossman & Brother, who are well known authorities on the coffee market in New York, have issued a circular in which they say—

(1) That the enormous increase in coffee production in Brazil, and the consequent lower prices, are directly due to the depreciation of the milreis.

(2) The only way to decrease production, and increase prices, is to double the value of the milreis.

(3) That, so far, the Government Currency Policy has resulted in no tangible improvement in the milreis, and that the entire element of planters and agriculturists are stubbornly opposed to any advance in the sterling rate.

(4) That land once put under coffee must remain under that product, as coffee takes four or five years to come into bearing, and then continues to bear season after season for many years. Besides, it cannot like wheat and cotton, be diverted to other channels of consumption (*i.e.*, put to other uses than that of a beverage, pure and simple, when prices are very low.

(5) The present production must therefore continue for some years to come, and the only means of curtailing production is a constant lower price for coffee. All the efforts to raise prices so persistently made can only result in further disaster to all concerned.

Messrs. Crossman are no doubt justified in laughing at the attempt to bull the market on the report of a solitary case of bubonic plague at Santos and at the idea, attributed to Brazilian planters, to continue growing coffee at extremely low prices in order to extinguish coffee-growing in other countries and then fix their own price for the article. It is, however, doubtful if they are correct in saying the present rate of forty milreis a bag (say, 22s. a cwt.) pays planters, and that it would require a fall to thirty milreis a bag to curtail production. Another factor in the problem has appeared, of which Messrs. Crossman take no account. Present prices are so unremunerative that not only cannot planters, two-thirds of whom are heavily mortgaged, meet their liabilities, but they cannot even meet current expenses. To endeavour to do so, they have reduced wages, with the result that 15,000 colonists have left Sao Paulo in two months, and 60,000 are said to have booked their passage to Europe (*Rio News*). When we remember that the increase of Brazil production had only been rendered possible by the labour of these colonists, we realise that there is a very serious chance of the immediate curtailment of production. Both the *Rio News* and *Brazilian Review*, who are by no means generally in accord on the present crisis in coffee, agree that it is probable labour will be short in Sao Paulo, and a good deal of the growing crop may not be picked. Planters who remember the days of heavy crops and short labour in India will realise how much of a crop can be lost by want of labour at the right time. The complaints of the Wynaad Association to Government in the sixties and seventies are full of complaints of losses of crop from this cause. And those who knew men who went through the crisis after the American Civil War have heard of whole estates being abandoned in North Wynaad,—not because coffee did not flourish, but because there was absolutely no money to be had for any purpose in Bombay, from which centre that district was then financed. The Brazilians are feeling the shortness of labour now, and will probably begin to feel a dearth of money presently ; for no financiers can afford to go on for long working so vast an industry at a dead loss. No doubt the best estates will survive, but it is only necessary for the poorer to be extinguished for a curtailment of production to ensue.

The Brazilian advocates of sound finance are by no means discouraged by the present slight relapse in exchange, and say the Government moratorium scheme has done all that could be expected of it in the time. There is not the slightest chance, whatever the agriculturists may say or do, of the Brazilian Government refraining from carrying out its present policy to the bitter end, any more than there was or is in India. And, as in India, the full effect of that policy will probably not be felt till the third year of its existence. This year, anyhow, the advocates of the Government policy expect the effect to be largely neutralised by the heavy loans contracted immediately before the scheme was put in force. These debts have now been repaid, and next year the scheme is expected to have a greater effect ; but the full effect is not expected to be felt till 1901.

W.

TOBACCO.

Dear Sir,—In your issue of 11th November, "Chungu" said he had topped his tobacco at 18 inches, and wished to know to what size the leaves should grow.

The height at which topping should be effected depends on the richness of the soil, the vigour of the plant, and the kind of tobacco cultivated. In Saigon, 16 to 20 leaves are allowed to develop ; on the plant in France, only from 9 to 12. Similarly, the size of leaf must vary according to soil, species grown, &c.

I would suggest that "Chungu" should not allow his plants to bear more than 12 to 16 leaves each. He ought then to stand a fair chance of getting a good quality.

Gowcha.

THE FUTURE OF COFFEE.

In your last issue you published a letter from Mr. W. H. Crossman, of New York, saying that he could "see no way out of present conditions, except by patiently waiting until the production shews signs of decrease—until natural causes bring about a reduction of supplies; and, from all appearances, such results are a long way off." These natural causes, he explains, are that Brazilian coffee should fall from 40 milreis per bag, which he takes to be its present value, to 30, or less! A bag is 60 kilogrammes, or about 132 lbs.; and, as he takes the milreis at 7d., 40 milreis per bag would mean 19s. and 9¼d. per cwt.; and 30 milreis per bag, only 14s. and 10⅓d. per cwt. If his conclusions be just, they are very discouraging to Indian coffee planters; for, as Mr. Crossman declares that he has no faith in the scheme of the Brazilian Government to appreciate tangibly the value of the milreis, it is clear that the reduction he contemplates must be in the sterling (or gold) value of coffee; and it is certain that such a fall in the gold price of Brazilian coffee would mean a further heavy fall in the price of the Indian article. Let us hope, however, that Mr. Crossman is right in thinking that these results are a long way off.

On the other hand, in Saturday's *Madras Mail* (25th Nov.), there is an editorial in which your contemporary shews that the Brazilian Government is faithfully adhering to its engagements, and implies his faith in the success of its scheme for rehabilitating the milreis. So far from thinking a further fall in the price of Brazilian coffee necessary to check production, he assures us that, at present prices, planters there are not able to meet their current expenses, and that they will be unable even to pick their crops; and, though low enough in all conscience, present prices are not quite so low as Mr. Crossman states. Your contemporary goes on to say that 15,000 labourers, chiefly Italians, have left the country, during the last two months, and that 60,000 have taken their passages. He writes particularly of the Sao Paulo district (Santos coffee), in which the greatest increase in the production has taken place. This is, for the Indian coffee planter, a much more hopeful view of the situation. The question is, Is it true? If not, however comforting it may be to harassed planters, no good can result from preaching peace where there is no peace.

I have, now lying before me, a most interesting article on the cultivation of coffee in the State of Sao Paulo, from a French point of view, which appeared in the February, March, and April Nos. of the *Revue Des Cultures Coloniales*, and which is written by a Monsieur A. R. Conty, a French official, who visited a number of plantations, in the State of Sao Paulo, with the view of ascertaining whether coffee would be likely to pay in the island of Madagascar, which has been lately annexed by the French. He takes the value of the milreis at about 8d., and informs us that the whole crop of an estate is worth, on an average, milreis 13,725 per "arroba," in the Santos market. An arroba is 15 kilogrammes, or about 33 lbs.; so that the mean price of the crop at Santos, according to Monsieur Conty, would be 31s. and 6d. per cwt., which is certainly much nearer the prices quoted in the market reports than the figures given by Mr. Crossman. Monsieur Conty's paper is ably and dispassionately written, and he seems to have spared no pains to arrive at correct conclusions. He was welcomed not only by the French Consul, but by the President of the State of Sao Paulo, who sent him free Railway passes for himself and his staff: and the Consul convened a meeting of the leading planters and introduced them to him. He also gave him free access to all the records of the Consulate; and the planters, following suit, received him with the utmost cordiality, shewed him their accounts, took him all over their estates, gave him all the information in their power, and readily prepared such estimates as he required of their expenses and receipts. Under these circumstances, and on account of his official position, Monsieur Conty had peculiar facilities for arriving at the truth, and his conclusions are probably exceptionally correct.

Monsieur Conty gives several estimates which, considering that they were furnished quite independently, some by French and others by Brazilian planters, agree with each other extremely nearly, infinitely more so than the estimates of Indian planters, amongst whom the system of working and the out-turn would appear to be not nearly so uniform as in Sao Paulo. I take the first, which shews that the cost of producing one "arroba" of coffee, from an estate in full bearing, and laying it down in the market of Santos, is, including the broker's commission on its sale, milreis 6·46; and its average value milreis 13 725, or a profit of more than cent per cent. on the outlay. As stated above, the arroba is 33 lbs.; but it is indifferent what is taken as the unit, the proportion is the same. Monsieur Conty, however, draws attention to the fact that he has omitted interest on capital, and the living expenses of the proprietor. Also that the cost of carriage to Santos would vary slightly with the distance between that port and the estate.

Now if, disregarding the cost of living and interest on his capital, the planter can realize a profit of cent per cent. upon the working expenses when the milreis is at 8d., it is clear that he could just pay expenses if the milreis went up to 16d. But planters must live, if they are to go on working, and interest must be paid, at least when the estate has been bought and worked with borrowed capital, so he would probably have to stop about when the value of the milreis reached a shilling. On the other hand, we must not forget that coffee, when once it comes into bearing, goes on yielding something every year, for a long time, even if left entirely to itself; and this circumstance would no doubt prolong the struggle.

Altogether the question is one of the greatest intricacy, particularly as the reports which reach us are so utterly conflicting that it is almost impossible to form an opinion worth having. But I may safely advise Indian planters, whilst hoping for the best, to prepare for the worst, that is, to economise, as far as they possibly can, and to set seriously to work to raise subsidiary crops of anything that will pay, in case coffee should fail them after all.

COFFEE PLANTER.

GENERAL ARTICLES.

THE MILD COFFEE TRADE IN THE UNITED STATES.

Mr. Arnold Schramm writes in the *American Grocer*:—

My first acquaintance with mild coffees dates from 1866, when I entered the service of a concern with the euphonious name of Schmilinsky, Lotz & Co. At that time, this concern, Maitland Phelps & Co., and E. Pavenstedt & Co. controlled the Maracaibo business, and each house had a line of sailing vessels (brigs and schooners) plying between New York and Maracaibo. Owing to the shallowness of the channel over the bar, and which continually

shifted, the vessels all had to be of light draught (about eight feet), and were, consequently, necessarily small, fetching not over 3,000 to 4,000 bags at a time. The largest house here at that time in the Maracaibo trade was Schmilinsky, Lotz & Co., which did almost no other business, and their Maracaibo house, Schmilinsky & Co., was then, by all odds, the largest concern in Maracaibo. Neither firm now exists.

The output of Maracaibo coffee was then certainly not over 10,000 bags annually, and was not of any uniform weight. Trujillos, for instance, were frequently shipped in eighty-pound packets or butts, and the bagging was often so wretched that the coffee squeezed out through the meshes. The Cucutas, however, came in fine grass bags, splendidly woven (mostly in the penitentiary of Pamplona), and very strong. These weighed from 125 to 130 pounds. At that time, all Maracaibo coffee came in grass bags, or *figue*, both large and small, and no one would have considered a differently bagged coffee genuine or bought it. It was a saying, "If not in Maracaibo bags, it is not Maracaibo coffee."

The Laguayra and Porto Cabello business at that time was almost entirely in the hands of John Dallett & Co. (later Dallett, Bliss & Co.), of Philadelphia, who ran a considerable line of sailing vessels between Philadelphia and Venezuela. The firm name was changed several times, and finally the house removed to New York. This concern was the first to see what a splendid chance there was for starting a steamship company, and in doing so rapidly drove the sailing vessels out of the trade. The line was exceedingly successful, and to this day has a monopoly of the business under the name of the "red D Line," controlled and managed by Boulton, Bliss & Dallett, who are the direct successors of the old firm of John Dallett & Co.

Laguayra coffee (under which name is comprehended washed and unwashed Caracas and Porto Cabello coffee) was, of course, at that remote period not nearly as important an article as it is now, but it has by no means increased in proportion to Maracaibos, under which general name are classed the various Cucuta, Tabira, Merida, Bocono, Jovar, Trujillo, and sometimes Coro coffees, which are exported from Maracaibo. The export of Maracaibos is now about 400,000 bags annually of perhaps an average weight of 130 pounds each, and nearly all of this goes to New York, from where, however, at times, small lots are sent to Europe.

Coros should be classed by themselves, and are not an important item, as 50,000 bags probably cover the amount annually exported. In quality they are between Laguayras (Ports) and low grade Maracaibos. The production of all kinds of Laguayra coffee is probably not over 400,000 bags of 130 pounds each per annum, though it may be somewhat more.

Thirty years ago Savanillas were also a very unimportant item, and 60,000 to 80,000 bags would certainly have covered a crop which has now grown to fully 400,000 bags or more. Then everything was used for bagging, much of the coffee coming in hides, called "bull-heads" because they were lapped into for an almost round package, and were so tough that it required a very sharp knife to get through. The "Savanilla" consisted then principally of Rio Hache and probably Ocana coffee, but it was not classified, and, strange to say, brokers in milds furnished the importer no "gradings" in the sense of the present day. All was sold under the one name, and the general quality was wretched, being full of black beans, stones, etc., and was frequently false packed. One of the honest (?) planter's tricks was to "stovepipe" the bag—viz., set a hollow-like stove-pipe into the bag after a little coffee was in it, and then fill this with black beans or rubbish and fill all around with good coffee also on top after the pipe had been withdrawn. The short trier of those days did not go far enough into the bag to discover this and other frauds, and hence the long one was invented which is now in use. Many mild coffees arrived at that time with all kinds and grades in a bag, being probably just as the storekeeper would fill them up with what women and children brought in exchange for groceries.

While Central America was even then quite a coffee-growing country, yet the output was very small as compared with to-day, when Guatemala, Salvador, Costa Rica, Nicaragua, and Honduras, together comprising what is known as Central America, produce at least 1,250,000 bags annually. The weights vary considerably in the different countries, but the average must be fully 135 pounds per bag. Formerly, much of the washed coffee from there was "hidey"—*i. e.*, smelled like decaying hides—and others again was "cheesey," "sour," "rubbery," etc. This was particularly the case with Costa Ricas, and is all owing to defective curing, and probably not at all to hides; it is fermentation in various stages—very properly called *fermentado* by the natives.

Thirty years ago the Mexican crop was a very small quantity, the bulk then, and for many years after, going to France. Now it is quite a crop, amounting to probably anywhere from 450,000 to 600,000 quintals of 100 pounds each per year. This coffee comes in all kinds of packages, from the 200 to 220-pound bale to the 100-pound mat or package. Europe still takes much of it, and here New Orleans probably receives more than New York.

The Haytian crop, which now averages probably about 80,000,000 pounds per annum, was, comparatively speaking, an important factor as far back as I can recollect, and in past years was used here much more than now. I suppose this coffee, same as many other milds, has suffered very severely by the competition of Santos coffee. When I was a young man Santos coffee was practically unknown, while Rio was a very important factor; but now all this seems reversed, and though still very much Rio is grown, the great competitor of all middle-grade milds seems to be Santos, to the production of which there appears to be no limit.

Formerly East India coffees (all sold as Javas) were the great mild coffee, and then there must have been an output of fully 2,000,000 bags (or piculs) of this and also 1,200,000 bags of Ceylon coffee. The latter, through the ravages of leaf-disease and other causes, is now almost an unknown quantity, and Javas are reduced to probably 500,000 to 600,000 piculs.

Nowadays one never hears of Manilas, Singapores, Macassars, etc. Jamaica coffee is not now, nor ever has been, a crop of any magnitude, and the same holds good for many other mild coffees. A few new coffees, such as Hawaiian, etc., have appeared, but seem to amount to very little as yet, while in Brazil, the districts of Victoria, and Bahia, practically unknown thirty years ago, have become very large crops—of 250,000 bags for one and possibly 500,000 bags for the other. Porto Rico, our new possession, always grew more or less coffee, and its output now varies between fifty and eighty million pounds, according to poor and good years. It varies exceedingly. Now, with the stimulus of patriotism added (and a possible future duty), this coffee should come into more prominence; but I think no amount of fostering will ever make it a very large crop (not over 100,000,000 pounds), as the area is restricted.

The country that had a chance, on account of unlimited area and a large population, to compete was Mexico; but it is only on a silver basis, while Santos is on a paper basis, and its coffee is grown by aliens (Italians), who are said to live in shacks, without families to support, and subsist on maize and beans grown by paper labour. The clothing is said to consist of an old bag with holes cut for the arms. It can be seen from this that people who have any self-respect and want to "live" cannot compete with Santos, unless it be Guatemala, where the labourers (or *mozos*) are Indians, and which country is also on a paper basis, and the Indians live on maize, beans, and bananas, and dispense with the bag. They are thus one empty bag ahead.

Mocha coffee seems to become less important every year, and the former annual importation of, say, 40,000 quintals is decreasing continually, because people have discovered that "Bourbon Santos" is a perfect substitute for this world-renowned humbug, and in the cup is fully as good. Mocha, the total crop of which is perhaps 150,000 quintals, is an acrid and rather unpleasant coffee, which has been assiduously boomed by writers who likely consumed chicory for coffee and did not know what they were talking about. Why, the other day I came across a book, the writer of which claims that Bahia is the best coffee in existence. It is now pretty well established that Bogota is the king of coffees, and few blends for fine family trade are put out without putting in some of this.

There are still any number of minor crops of mild coffees which I might enumerate, but it would make this article too lengthy. The various varieties and sub-varieties run into hundreds (if the numerous Asiatic coffees are taken into account); and, after all, the proper making is coffee fully as important as the coffee itself. If coffee is boiled, like peas, then any coffee will be vile. If coffee is only toasted, or is roasted to bitterness, then no matter what it was or how carefully prepared, can you get a good cup of coffee. The very success of the cheap and nasty Brazil package coffee proves that to many people "all coons must look alike," and on such, a good coffee is thrown away. The only proper way to get good coffee is to have it roasted sufficiently, ground finely, put into a

bag or sieve (or a machine properly constructed to effect the same purpose), percolated by slowly pouring hot water through it and serving it at once. Any coffee is destroyed by standing.

I would have liked to end this article by giving you correct statistics as to the production of mild coffees the world over; but, as I have tried for years to do this and failed, I have at last given up in disgust. Our Government, which professes to be so solicitous about the welfare of its subjects and to aid commerce, could easily obtain the correct figures by instructing all consuls in coffee-exporting ports to obtain figures representing the total exportation in pounds from each port to all countries, and adding these together for each country would give the total output of that country.

One would think that the correct figures for the production of Mexico and Central and South America could be obtained from that invaluable institution known as the Bureau of American Republics, but an application to them results in receiving a few ridiculous pamphlets, in which one may find a few figures, perhaps, giving the alleged exports in dollars. This for an article varying from 6 to 22 cents, according to crop conditions and the native dollars from gold to paper money at 900 per cent. Such information is truly wonderfully valuable. I also addressed myself to the accredited representatives of the various countries, and though about all replied very courteously, yet only a few seemed possessed of more or less accurate figures.

The manner of selling coffee seems to have changed entirely within the last thirty years. When I first came down town, every wholesale grocer and all roasters, large and small, bought from the importers; but large jobbing houses also existed, whose chief trade seemed to be out of town, and also considerably in the city. These houses for a while became more and more important, and seemed to almost get control of the business, resenting the selling by importers to grocers and all but the largest roasters, until it became an almost established custom that a broker would hardly seek for any outlet but these large jobbing houses and the few largest roasters. For a while most of these jobbers also became importers from certain countries; and for all that, though Brazils were then sold by them and the importers to everybody, and also importation orders for large and small quantities solicited, yet milds continued to be tributary to the jobbing houses that were left after the failure of many of the largest who had ruined themselves by coffee speculations

Meanwhile, one roasting house, and subsequently many others, started in to sell Brazil Coffee in packages; and everyone knows what a phenomenal success they met with, and seem to be absorbing more and more of the business. Milds have so far been fortunately kept free of cheap package coffee, though many blends—generally of very good quality—are on the market, one house having made a fine success in putting these blends of milds on the market; yet, outside of this, the greater part of the mild business seems still to be in bulk coffee as in former years, and it looks now as though a great many of the more far-sighted wholesale grocers and also smaller roasters are again endeavouring to buy direct from the importer, feeling that in order to meet the competition of the cheap Brazil package coffee they must secure coffees at as low a figure as possible. The great stumbling-block, however, as yet is the fact that the retail grocer still exacts an exceedingly high price for the milds that he sells, and yet seems willing to sell, side by side and in competition with these, cheap Brazil package coffee at a nominal profit, in this way cutting his own throat.

THE LONDON CHARGES OF TEA COMPANIES.

IV.

Before closing this series of articles upon the expenditure of tea companies, a word must be said upon agency charges. To speak to the purpose, we shall have to go beyond the sphere of mere London charges, and, in doing so, tread upon delicate ground—so delicate that many friends may consider us to be unduly officious; but the subject assuredly requires examination, and it may be at once stated that the agency system is honeycombed with abuses. After devoting a good deal of attention to the matter, we are firmly of opinion that the agents of Indian tea companies at least—we do not hear so much complaint about Ceylon agents—ought not to play such a prominent part in the management as they now do. The undue importance of these firms, who ought to be fetchers of water and hewers of wood for the London Board and the garden establishments, has been sanctioned by the record of a long series of years for most part of the tea companies have sprung directly from the operations of Calcutta firms who remained their agents. With business, such as that worked by the Indian tea companies, in which the great bulk of the supplies and stores to the gardens passes through Calcutta—and the whole of whose output finds its way there—the companies certainly require faithful representatives at that city who shall superintend these operations. It may also be advantageous here, at this central point, to be in touch with a firm of importance ready and able to give immediate advice and assistance should the management at the gardens fall into disorder. So much must in fairness be admitted, and we believe that no company, however free from agency influences, is altogether independent of assistance of this character. But in regard to many Indian companies, we find a very different state of things prevailing. These Calcutta agents, instead of meekly obeying the behests of their employers, have adjudicated to themselves the *rôle* of managing the whole concern. With a subordinate firm in London, they throw out one long arm to stifle the independence of the Board of directors, and under a Draconian system of control, stretch another into Assam or Darjeeling to throttle the power and independence of the officials at the gardens. The consequence is that both classes of the company's officials suffer from mental deterioration. Too often the directors are mere creatures of the agents who manage the estates, and the men placed over the estates themselves are often utterly unknown to the directors who ought to control their actions. Everything, in short, is managed by the agents, from the purchase of the most insignificant article for the estates to the selection and appointment of the superintendent. Can it be wondered at that, under these conditions, Boards of Directors have sunk into mere ornamental choruses, apparently salaried by the agents to act as "whipping boys" should matters go wrong? And the effects of the system must be just as harmful to the *esprit* of the garden managers. What benefit is it for these managers to give up their lives in the unhealthy climate of Assam and Bengal if, when their efforts towards improvement are crowned with success, the Calcutta agents come forward gracefully with hand on breast to take all the praise that directors and shareholders may be inclined to accord?

In these remarks we have taken matters at their worst, and we are quite prepared to admit that this autocracy on the part of agency firms has in cases worked well. The agency firm has stood behind its offspring at critical junctures, and by care and good management has brought them through times of trouble and anxiety. But proof that the system works badly, on the whole, is afforded by the fact that every really strong Indian tea company has shaken itself free from such tutelage. Companies like the Jorehat, the Assam, the Lebong, the Doom Dooma, and the Dooars have long been managed entirely by their London Boards and garden staffs, and who can say that they have suffered from the reform? Frankly we believe it is the manifest policy of agency houses to prevent their controlled companies from becoming too strong in a financial sense, because, when they do, the shareholders are apt to consider that the agent's services are rated upon too high a scale. To keep the companies in subordination is unfortunately often an easy matter, since the embarkation upon a policy of extensions, accompanied as such a policy so often is by the necessity of borrowing up to the hilt, is calculated to strengthen the hold of the agents over the companies, and that for an indefinite period. They, too, often have control of the borrowing powers of the company, and then naturally the authority of the directors becomes a mere farce. In saying this, we cannot deny that, in some instances, agency charges have been materially reduced from what they were in the old days. At one time agency firms seemed to levy toll upon every thing in connection with a tea company. There was a charge for management, a precentage upon every purchase of stores or material, a percentage upon every ounce of tea sold, a percentage upon the money borrowed, a percentage upon the money lent, a percentage upon every coolie engaged, and a percentage upon every cubic foot of shipping space employed. To the credit of all concerned, many of these objectionable charges have disappeared, but none can tell how far they have ceased to enter into the expenditure of some of the companies. No information on this head can be obtained from a perusal of their reports, for it is only those companies that have shaken themselves free from the incubus, that really set forth their accounts intelligibly in this respect. About secret dis-

counts and allowances, we can therefore say nothing; but turning to the admitted charges, we can point to some glaring inequalities that ought to bring the importance of the subject home to the minds of shareholders.

Whatever may be the demerits of the companies controlled by Sir John Muir, their directors have had the grace to bluntly state the agency charges imposed upon them in a clear and intelligible manner. Comparing these charges set forth by two of his important companies—the Amalgamated Tea Estates and Consolidated Tea and Lands—with the sums spent upon similar services by the Assam and Doom Dooma companies, we have the subjoined results:—

	Value of Crops.	Calcutta Agency Charges.	Percentage of these charges to value of crop.	London Agency Charges.	Percentage of these charges to value of crop.
	£	£		£	
Amalgamated Tea Estates	108,893	2.743	2·51	2,433	2·23
Assam Company ...	177,180	880	·50	2,303	1·30
Consolidated Tea and Lands ...	332,475	8,061	2·42	6,037	1·81
Doom Dooma Company ...	94,873	476	·50	517	0·55

In these calculations we have taken in each case the result for 1898, including, of course, in the London agency charges of the Muir companies the separate charge of office expenses, an expenditure entirely covered by the sums set down for the London expenses of the other two companies. The discrepancy between the results is too glaring for comment, and we need only say that the Assam Company is considered to have heavy London expenditure. In these figures we have not taken into account any commissions upon profit taken by agents, and it is interesting to note that the swaddled conditions of the Muir Companies does not prevent their two Boards claiming between them £4,400 in fees, against £2,156 taken by the Boards by the other two companies. To demonstrate the outrageous character of these charges, we might put the matter in another way. The Consolidated Tea and Lands Company earned last year from sales of tea a profit of £34,491, and, in order to do so, it paid away in agency and office charges no less than £14,098. We believe that the Muir Companies are the worst examples, but how many others approach in any degree the thriftiness of the Assam or Doom Dooma concerns?

Now the remedy for all this is an improvement of the *morale* of the London Directors and the garden staff. Upon every London Board of a tea company there ought to be at least one experienced planter who shall be in a position to visit the estates at certain intervals. Then the superintendent of the gardens should have wide powers, controlled in a measure by the necessity of his writing periodic reports to the London Board. Then the Calcutta agents should be paid for their services by a fixed sum, not dependent upon the gross outturn, and the same method should be adopted in regard to the London offices If it be considered cheaper, as it often is, to farm out this source of expenditure, then that should be done Only in doing it, care should be taken that all secret commissions and discounts should be swept away, for it is far better to pay a higher fixed charge for agency service than to be bled in every vein by leeches that feed in darkness. We know for a fact that important companies have altogether swept away these concealed sources of agents' gains, and patience and perseverance on the part of directors and shareholders will do wonders. It is not maintained that many companies can be worked as cheaply as the Doom Dooma; and, in fact, no fixed rule can be made, but some percentage nearer to its figure than that of the Consolidated Tea and Lands is quite within the range of attainment. Finally, the supporters of the present system may triumphantly point to the articles of association as preventing any such reform. Well, articles of association are made for the convenience of the company, and, if the company so desires, they may be altered.

With this article we for the present conclude the series upon the expenditure of tea companies, and must leave the carrying out of the reforms suggested to the shareholders and the boards most interested. There will have to be further wringing of directorial hands and weepings when the results of this year's working are announced by the weaker companies, and then will be the time to press for the reforms suggested. When the chairman at the meeting talks largely and diffusely about exchange, earthquakes, heavy rains, and the draft question, the discontented shareholders will do well to bring him back to plain business again, by a few question as to whether he and his fellow-directors have endeavoured to put an end to those leakages in profits to which we have pointed. A little light upon these subjects, and, perhaps, correction of our errors, will be preferable to the wearisome repetition of platitudes—generalities usually provided by the boards on such occasions. If they like, and it makes them feel any happier, the speech-makers can spend some of their breath in cursing us, for then they sometimes grow amusing. We care not what they say if shareholders will only rouse up and insist upon the stoppages of leaks and on honest, capable, and economical management. —*Investors' Review.*

RUBBER IN BRITISH CENTRAL AFRICA.

W. B. writes from Mlanje to the *Ceylon Observer*, under date October, 21st:—

THE CULTIVATION OF RUBBER

would seem to deserve the serious attention of the capitalists, for there appears to be no limit to the demand and increasing uses to which this product can be put; and in the course of years, not very many I should say, the present supply must become very limited. I have read with much interest the articles appearing in your *Tropical Agriculturist* from time to time on this subject. I shall now venture with a few remarks on the subject myself.

Central Africa, from what I know of it, and what I have read, does not furnish a vast or unlimited supply of rubber vines or trees. The whole country from north to south, and from east to west, is a bush-grass field, as one may call it, covered with native grasses with single fire-proof trees standing in it from 10, 20 to 30 yards apart and on many places thinner; and the bulk of the country has no trees at all. The forests are few (very limited in extent) and usually only in gullies and strips on the sides of the higher ranges of mountains. Stanley's dark forest, of course, is an exceptionally large piece of the continent.

Now the bush country contains no rubber-yielding vines or trees, except by the sides of some streams which have a small bulk of trees left by natives to conserve water, so it is not difficult to see that the supply of

RUBBER FROM AFRICA CANNOT LAST

especially owing to the wasteful way in which it is collected.

There are only two vines in British Central Africa from which rubber is collected by natives, *viz.*:—*Landolphia Florida* and *Landolphia Pertersiana*, very small delicate vines, only to be found in *forest* which the bush fires don't run through. Traders are offering 1s. to 1s. 6d per lb. for this rubber and engage squads of men to search every nook and corner for it, regardless of the method of collecting.

The Negro finds a vine or two, climbs the trees to which they are attached, cuts the vine in sections, even the very primary roots he cuts, and carries away the whole thing to the nearest path, or his camp, where he slices away at the bark just as he fancies, till he gets a small ball of a few ounces (the rubber coagulates as fast as exposed, and is gathered at once) and off he goes in search of more. The primary roots being cut, and the root bulb removed, the vine is done for, as no shoots ever spring from the roots left in the ground. Some useless and, it would appear to me,

UNWORKABLE RUBBER REGULATIONS

have just been published by H. M. Commissioner for B. C. A. What is wanted is to restrict the collecting of rubber altogether, except by license under proper supervision: even then I question very much whether the Congo Free State, B. C. A., and the South African Co. will permit the destruction and ultimate extinction of the "goose that lays the golden egg" in their territory.

I do not think many years are wanted to exhaust the rubber supply of East, Central, and West Africa, though West Coast exports have fallen off greatly during the past few years. We have several large forest trees here, which yield rubber, and one large vine that is not tapped by natives as the caoutchouc does not readily coagulate.

One of those trees answers to the description of *Kickxia Africana*, a West African rubber tree; another I take to be *Ficus Elastica*. The yield of the latter would seem to be very large. I set two men to work on a large tree in my forest; and in about eight hours

they brought in over 1 lb. of rubber each in the evening. It took the whole day to coagulate. The men cut slits out of the bark, which is very thick, and allowed the rubber to collect and set in them. I have sent rubber and herbarium to Kew for identification.

The vine rubber, &c, I have also sent to Kew. I was always struck with the enormous amount of caoutchouc this vine yields: it simply runs out of a cut in the bark for any length of time, and I was

LED TO EXPERIMENT

with some from what I read in your *T A*. I went to the forest with two men and from one vine, in the course of a few hours, we returned with two quarts of caoutchouc. Into one quart, I stirred half a tumbler of water, in which one tea-spoonful of J T. Morton's tartaric acid was dissolved After a little stirring, the contents coagulated the same as butter would come in a churn I then went to the bath-room and washed the rubber, squeezing it and working it in my hand for some time, till all the refuse was washed out, when I had a piece of beautifully *pure* rubber quite white. When exposed it turned reddish grey in colour. The other quart I boiled pure and simple without the addition of any acids. In a quarter of an hour, stirring all the time, I got the same result. Gradually the rubber stuck to the stick until all was collected. This seemed to take place gradually as the water evaporated until I had one lump like very thick porridge, which I tumbled out on a board, poured water on it, and worked it about till I had

A LOVELY PIECE OF RUBBER

much nicer looking than what was made with the acid—more elastic with a pretty bluish transparent look about it. I am sure the above treatment is simple and inexpensive enough, and perhaps better results may be got than by the use of patent machinery I shall try the churning; but as the use of my dairy churn is prohibited, I shall have to construct one for myself. I shall let you know the result in due course.

The above mentioned vine is very hardy, easily propagated from seed, and only takes about ten years to become fit for tapping, with a stem a foot in diameter. I am thinking of

PLANTING IT ALONGSIDE ALL THE SHADE TREES

in a coffee clearing on which native shade was left, although the coffee is a decided success so far up to 18 months old. I do not think the rubber vines would do any harm; and, of course, it is always better to have two strings to one's bow.

THE LONDON TEA MARKET.

"Suum Cuique" contributes to the *Ceylon Observer* a very interesting paper on "The 'Knock-out' in the Tea Market." We quote it in full :—

THE "KNOCK-OUT" IN THE TEA MARKET.

In spite of many assurances to the contrary from those interested, for some time it has been generally known that a unity of action existed among the larger buyers of tea, which has now assumed the shape of 'The Tea Buyers' Association, with the object of buying collectively at the public sales and acting on the lines of what is generally known as "a knock-out." There is no doubt about it, and after all it is only an outcome of the modern mode of doing business. Anyone who likes to go to Ingram House, 165, Fenchurch-street, can see the title in the porch :—

THE TEA BUYERS' ASSOCIATION.

Most of the following was compiled in January, 1899, by one who had previously devoted some months to studying the Tea Trade in all its branches, from arrival of its produce in London to its retail —comparing it with the other large industries, such as brewing, distilling, iron, cotton, leather, &c.; in search of any information likely to be of service in improving the system of selling tea.

In carrying out this, his endeavours have been to adhere, as closely as possible, to simple facts and direct conclusions, and so avoiding all that is remote, or complex.

The Tea Planting Industry of India and Ceylon is now suffering depression from four causes :—

1st. An arbitrary action of the Indian Government, affecting so-called exchange.

2nd. Occasional and periodic rushes of tea from India and Ceylon upon the London market, necessitating some order and regularity in the quantities offered for sale weekly.

3rd. The want of definite and reliable information on the quantities of tea produced and likely to come forward from India and Ceylon.

4th. The same collective care in selling that is exercised in buying teas.

Temporary over-supply seriously brought down the price in the tea market during the early part of last and this year: and although the statistical position of all teas, a little later, shewed the stocks to be almost identical with those of 1897, yet there was no reversion to the prices then ruling, at least for Indian teas. Ceylon, by extra fine plucking, has barely (1898) maintained its average price It is observable, however, *that a return to what economists call an equilibrium of the market, does not re-establish a relative and permanent recovery of price.*

There is also every indication that the market has hitherto periodically suffered far more from the irregular manner in which produce has reached it, than from over-production, although the position has been very nearly reached.

Some years ago, when consumption was smaller, the public sale market in Mincing Lane was frequented by a proportionately larger number of tea buyers than now: tea was brought in smaller parcels obtaining livelier competition.

PUBLIC SALES.

Now in spite of the so-called sales by Public Auction, everyone knows that by far the larger proportion of tea now sold in Mincing Lane goes from seller to buyer without any public competition whatever, it evidently being arranged beforehand who shall be the purchaser. Formerly, the statistical position of the tea market was no more favourable to growers than it is now; the present market, however, has ceased shewing the same response to improved statistical conditions as it then did.

Although the excessive supply of tea brought to sale during the past few years has gradually been worked off, assisted by the increased consumption of foreign markets, yet there is not the reacting buoyancy that the market should in consequence possess.

Nor is any one prepared to dispute that the buying of teas Mincing Lane has fallen into fewer hands, and that the results obtained are not so satisfactory as formerly.

Also few will admit that the market responds now as formerly to supply and demand; for, from a grower's point of view, whatever be the cause, the fact remains of the existence of some adverse influence somewhere. Consequently, if the present order of things continues unaltered, the open market is not likely to adjust itself in any adequate degree.

The following table shews that something besides supply, demand and over-production have been influencing the downward tendency of tea prices, for the past 15 years, although probably the chief cause has been the irregular supply of the market.

HOME CONSUMPTION OF TEAS.

Memo. shewing the total home consumption of all teas, including India, China, Ceylon and Java; also stock at the close of each year with average of price and the proportion of stock to consumption over 15 years, in intervals of three years, from January 1st to 31st December in each year :—

Year.	Home consumption in	Total stock at the end of each year.	Average price.	Proportion of stock to consumption.
	Lbs.	Lbs.	d.	Per cent.
1898 ...	235,414,185	101,638,000	8·35*	43
1895 ...	221,731,490	103,480,802	9·63	46
1892 ...	217.135,679	98,244,217	10·07	45
1889 ...	185,578.298	113,189,357	10·79	60
1886 ...	178,800,197	103.157,446	11·77	57
1883 ...	170,780,777	118,060,000	12·46	69

* 8·35 is only approximate.

The foregoing table proves that just the opposite has happened to what would be expected. A proportionate reduction of stock should be followed by a corresponding rise in prices and a proportionate increase of stocks by a fall

This surely shews that some other influence must be at work, there is no natural response to supply and demand.

The progression of the figures from ·43 to ·69 are *gradual* over 15 years, so the result can scarcely be considered accidental.

As a matter of fact, judging from all ordinary experience, the markets were proportionately overstocked 15 years ago, than they are now.

It is no use hiding the fact, that the influence of the regu

arrivals of Ceylon teas throughout the year has in a measure stopped the necessity of so large stocks—a secure condition which, if less assured, would be more to the advantage of tea-growers.

MARKETS.

Probably buyers have noticed that tea has gone steadily down for the past 25 years and so do not care to stock against a falling market. Reverse the order, even by the slightest degree, and the opposite will happen and this latter is urgently wanted.

CLOSING THE MINTS.

In spite of Great Britain's boast of Free Trade, the Indian and Ceylon tea-growers have suffered from the arbitrary action of the Indian Government, in protecting its own exchanges at the expense of exporters, by closing the mints which has been disastrous to tea-growers.

Without going unnecessarily into details, it may be considered that between the natural value of the rupee and its present forced value, that 1d. per lb. is added to the cost of production, which, roughly speaking, is almost equivalent to 4 per cent., profit on the average standing capital value of the tea property of India and Ceylon—a very serious loss of itself, but far more serious when regarded in its capitalized form.

If trade were conducted free of undue influence, from either buyer or seller, these unsatisfactory relations would soon re-adjust themselves; but with buyers becoming fewer in number, representing larger collective capital and working on larger lines, there appears to be evidence that they have undoubtedly obtained some undue influence over the market.

Within the last twelve months it was mooted that further amalgamations and the offering to the public of certain large distributing Tea Companies was probable, which would still further reduce the number of public buyers at sales.

Indeed it is not necessary to hide the fact that, for this purpose, capital is easily procurable, expenses of management saved, and additional power attained with every probability that these conditions will increase rather than diminish in the near future.

For, doubtless, in these large concerns with special organization, there arises a most careful scrutiny of where money can be saved or made; they also command the most efficient and skilled men, and with their increasing magnitude, opportunities in their dealings for keeping down prices will not be neglected.

As compared with butter, bacon, sugar and other groceries, tea is sold at a much higher profit by retailers, further evidenced by the gratuitous offerings to those who will only purchase their teas. Growers, if united, might have something to say on this; indeed, they would actually posses a power right through the trade, which, even if not used, would at least exercise some control.

PRICES OF TEA.

Unlike wheat and other annuals, the production of which can stop at the close of any season, tea does not come into heavy yield until four years after planting operations have begun, by which time it has attained a value which *necessitates* continued cultivation: consequently, from this cause among others, it is apt to arrive with considerable irregularity in the market and this produce falls in price, quite unexpected and unprovided for.

There is also a time in each year, usually during June and July, when it may be expected that the London market will become in-active owing to the bulk of new Indians shortly expected; and it is at this period of the year that the heavy shipments of Ceylon arrive. The consequent fall in prices that takes place then exercises its influence on prices throughout the remainder of the year.

Those who have studied economics know that the measure of price of the first transaction has a most material effect upon those which follow, and this principle is acknowledged by all traders.

If so, what can be expected from sellers in a market, who use no systematic and general mean of regulating the quantity of tea offered for sales and allow large and ordinary arrivals to take their place indiscriminately without attempting their regulation?

What would be thought of a man who rushed Company shares on the Share market without any regard at the time, whether they were wanted or not? What principle is right in an individual, must also be right in an industry, having similar pursuits and interests.

Doubtless, the permanent price of tea, from year to year, is ruled more by the *lowest price* of the market at the beginning of the season than by any other cause; and if these periods could be tided over without any material fall, a better price, until these circumstances occurred again, might be insured.

IRREGULAR ARRIVALS.

The effect of these irregular arrivals being thrown thus upon the market is bad enough on produce; but upon the capital value of property and upon the tea share-market, it may truthfully be said that recognised stability is destroyed; and there is every reason to believe that, unless some permanent equalising control can be brought to bear, this condition of things will most assuredly be *more frequent in the future* than it has ever been in the past.

Owing to the small margin gradually remaining to tea-growers to go and come upon, the collapse of prices, which takes place almost yearly, assumed a very serious aspect during the early part of last and also this year. This, however, might have all been moderated by the slightest equalisation of the quantities of tea thrown upon the market, from both Ceylon and India.

No fair critic would allow that, in the public auction sales, the buyer and seller are upon equal terms. The buyer can, at any sale, buy or not, just as he chooses; he claims the right of rebulking, objects to non sampling breaks, claims right of objection on every conceivable point, not the least of which is a regular outcry of "quality falling-off," whenever the market becomes a little over-supplied, leading to endless, and often useless, correspondence between London and the tea gardens.

Against these the individual seller has but one redress, a futile one; if the bid be unsatisfactory, he can withdraw his teas, but as, under the present condition of the market other sellers are easily found, he is no better-off. Individually, he is powerless, on the other hand; combined growers would have it practically their own way.

The buyer can always arrange his purchases so as to obtain a marginal profit on his re sales, which no ordinary circumstances are likely to upset, while with the seller everything is against a fair marginal profit at all commensurate with his outlying capital and yearly cost of production: so the only way this can with any permanency be retained must be by some collective means.

PROPRIETORS NOW RESIDENT IN LONDON.

The present system was unavoidable when the grower and proprietor lived abroad: but now the proprietary of tea-gardens chiefly rests in London, it is time more up-to-date and equitable terms of business were instituted between buyer and seller. If for no other reason, at least to be prepared for differential actions of Government and adverse defensive measures of trade.

It might be asked why sellers should not exercise the same controlling influence over the markets of wheat, sugar, coffee, cocoa, etc. The reply is, other markets compete with London in these, but London practically has the monopoly of British-grown teas; neither are these other products so favourably situated for the purpose, their growers being too much scattered.

Anyhow British tea-growers have object lessons before them in closed mints and sugar bounties; so may rest assured that any satisfactory countervailing influence will not arise unless they take a lesson *from the owners of the British industries* and either rise as one man and protect themselves, or allow the *interests of the consumer* to be alone considered, as with the West Indian sugar industry.

ASSOCIATIONS IN LONDON.

Tea-growers or their representatives do business with brokers, dock-owners, etc., *who all have their unions or associations*; and there are also very distinctly arranged understandings among tea-dealers and grocers; perhaps, not so definitely arranged, *but they exist*, or, as they know very well, trade would not be so advantageously done: unwise competition would as soon, with tea growers, make their business unsteady and insufficiently profitable.

Political economists lay down a maxim that what is division of labour in the individual becomes Free Trade in the State: so surely it is within the legitimate function of the seller to regulate his sales to the requirements of the market, without infringing the laws of Free Trade; and, if so, individually with division of labour, collective action does not alter the principle, but merely increases the numbers in operation.

Indeed, no principle of Free Trade is infringed and the evidence of one of the first Professors of Political Economy, on combining to regulate the sales of the tea market, is that it would be wise trade to do so.

It is certain that the ordinary operation of natural trade cannot fight against the differential impositions of the Indian Government, any more than a man who does not fully protect his own business can expect to compete with another who defends his at every turn.

No matter how necessary for the financial arrangements of India, it is not likely that the protective action of the Indian Government

would have been so widely approved, were it not that it gives immediate benefit to the official classes and to British investors in Indian finances. If the measures taken by India were necessary and so right, a similar course under the circumstances by the British Tea Industry *will not be less right*; federated, too, it will have sufficient power to carry out the measure.

SOMETHING MUST BE DONE.

Under any circumstances, as British-growers are at present placed, with a practically differential tax against their own products, with continued falls in price, irrespective of favourable statistical conditions, *something must be done* to prevent this continual downward tendency of the market. Last year, between May and August, tea fell ½d. and *there is no reason, as the market is at present constituted*, that it should not continue doing so unless some collective means are adopted to meet the situation.

PACKET *vs.* LOOSE TEA.

"A Teaman" writes in the *Canadian Grocer*:—

The tea question to-day is one of paramount interest to the grocer, because of the revolution that has been and is taking place in the trade in Canada and the United States We do not here refer to the ascendancy of Ceylon over Japan and all other teas, but to Packet *vs.* Bulk tea. While many have gone over to the packet, and are using all their energy to build up a trade in this form, others are wavering between it and loose tea. Then, again, a few others will not handle the packet at all, cherishing the hope that the tide will recede and leave them with a good bulk trade. These latter, to be sure, are few and composed mostly of the older generation of grocers. The question then is: "From which does the retail grocer get the most benefit, a loose tea trade or a packet trade?" The advocate of bulk tea will tell you that when you take hold of packet tea you lose your individuality. The advocate of packet will tell you that he is not in the business for "individuality," but to make money. The advocate of bulk will tell you that the profit is larger on bulk tea. The packet man will say that it is not, and that the packet tea shows the greatest profit, because it is an assured profit. That there is no loss in weight or in deterioration. And what is, perhaps, better, there is no bother in blending. More important still, it is not necessary to carry a heavy stock, which is continually losing its value.

Then, there is no responsibility. If the tea is not good the retailer is not blamed for it. And what is likely the most important feature of all is that there is no cutting in prices. The packet man will also tell you that if you want to see Packet *vs.* Loose tea, why look at the state of the Japan trade to-day against the black tea trade! He says that Japan has not been sold in packets, and the result is that to-day there is no Japen tea, sold higher than 25c., and a great deal of it is sold at 20c., netting the grocer about 2c. per lb. profit, whereas there is still a good trade in blacks at 40, 50 and 60c.

If it had not been for the introduction of the packet and the enormous advertising it received, the grocers would have continually been cutting prices of loose teas until the public would have been led to believe that there was nothing better to be had than 25c tea. This is what they accomplished with the bulk teas of Japan, and the same thing would have been accomplished with black teas had it not been for the introduction of the packet, its regular prices and no cutting. The packet man will tell you that it is a great advantage to have stock on your shelves which you can always return to the man from whom you got it. This you can do with at least one well-known packet, and, as you have not to purchase large quantities, you need only a very small stock; in other words, it is practically sold before it has to be paid for; whereas it is a common thing in the bulk tea trade for the retailer to carry $100 or $500 worth of tea, all deteriorating in quality, all paid for, although he did get long terms when purchasing.

And then there is "mine ancient enemy" the tea peddler. The packet has struck the hardest of blows at his occupation. Where the consumer favours the packet, he has no further use for the peddler as he does not sell the packet; in fact, he cannot get it to sell (at least, not the well advertised ones), and so he cannot any longer fool the consumer, and, if his occupation is not already gone, it is going rapidly since the introduction of the packet.

After all this is showered on one, he is half-convinced that packet tea is to be altogether the tea of the future. Then it is time to inquire what the reason of this is, and a large handler of tea states that the real reason is simply that the wholesale bulk tea business is not done honestly; in other words, that any man who tells the truth will state plainly that he dare not buy the tea that he knows to be the best (in the cup) at a given price. For instance: Four teas are shown at 25c. per lb No. 1 is the best. No. 2 the second, and so on to the fourth Now, he dare not buy No. 1 or No. 2; he buys the third or fourth, or the poorest of the four teas. Why? Because it is the best in style; nice black leaf, well rolled and with a nice golden tip; in other words, he buys what is known among the trade as a "flat catcher." No. 1 is really the best in cup, but has poor style and is a tea that would be very hard to sell If he buys it, it is sure to be a stock-keeper. He, therefore, buys the tea that is poorest in the cup and gives samples to his travellers, who, perhaps, not being excellent judges, or, if they are, not having the time or the opportunities of putting it against other teas at the price, consider it good value, and they go out and tell their customers so.

Now, if the purchaser in the wholesale house, who is a good judge of tea and knows the market, did not know that when selling bulk tea his responsibility ceased as soon as he sold to the retailer, he would not have been inclined to buy this tea. He would rather have bought the one that was finest in cup. Therefore, the position of the packet tea man, who pays no attention whatever to style and everything to cup quality, is the one that is likely in the end to find favour with the tea drinker And if with packet teas it is a case of the survival of the fittest, the grocer would do well to keep in the front rank of progress and not "lag superfluous on the stage."

PRODUCE AND PLANTING.

Twaddle about Tea.—The fact that the consumption of tea is increasing rapidly in the United States is perhaps the chief reason why certain people, whose hobby it is to attack everything that is popular, hasten to assert the danger of tea-drinking. One of the latest diatribes against tea is attributed to Dr. Kellogg, the founder of a sanatorium at Battle Creek, in Michigan. Tea, according to this investigator, is a most dangerous drug He tells of servant girls arrested in the streets of Boston for being drunk and disorderly who had tasted no alcohol, but who had "chewed tea constantly;" also, of an old lady in Minneapolis who drank thirty or forty cups a day and ended her life in a lunatic asylum. But even worse than these cases are those in which tea plays a more silent and insidious part. Among women it produces a kind of mania, "the mania for acting the persecuted saint." Among men, unlike the much condemned alcohol, it produces fear. One patient who was suffering from tea-poisoning in this way never passed a high building without looking up to see if something was going to fall upon him. Then the relentless Dr. Kellogg goes on to argue that tea is responsible for sleeplessness, and, in fact, most of the ills which flesh is heir to. We have heard all this so often that it has ceased to be funny. There is another kind of mania than that produced by drinking tea, and it appears to be brought on by the knowledge that a number of people drink tea in moderation and find pleasure and comfort in doing so.

Russian Grown Tea—The official report as to the results of the tea crops on the experimental tea plantation in Tchakva, near Batoum, shows that all the three crops collected produced exceedingly good tea. The Commission appointed to report classified the tea under two qualities, and came to the conclusion that the first sort could be sold retail at two roubles a pound As the best Russian tea is sold at two roubles, eighty copecks a pound, the two-rouble tea corresponds to tea at about 2s. 3d. in Mincing Lane. The Tchakva tea was appraised more highly because it was manufactured on the Indian and Ceylon method rather than the Chinese.—*The Home and Colonial Mail.*

A SEQUEL TO THE RECENT IMPERIAL TEA FIGHT.

"A. L. H." writes to the *Times of Ceylon* from London:—

Mr. McEwan, the London tea importer, the senior partner of Messrs. McMeekin and Co., who talked of fixing a libel case upon the *Times of Ceylon*, heard this week some more about that opposition to the draft abolition, in which he figured against the producers. Mr. McMeekin is the founder of the firm of McMeekin and Co., through whose countenance and aid Mr. McEwan has reached his present position. The poor health of Mr. McMeekin

the veteran Indian tea planter, necessitated his absence from London in the winter months which he has for some time past spent in the south of France. This absence gave more and more scope to the business abilities of Mr. McEwan. But the action in the matter of the draft dispute of putting up Mr. McMeekin's teas in aid of the dealers, to provide them with the means to carry on a war, which was diametrically opposed to the interests of Mr. McMeekin, was a source of great annoyance to the old tea planter. There were other causes for dissatisfaction, and Mr. McMeekin came to the conclusion that, he and his family, holding as they do the whole of the ordinary shares of the Allynugger Tea Company, Limited, and a good part of the Preference shares, must alter certain present arrangements. He made overtures to certain members of the Board, whom he was anxious should retain their posts, but, this coming to nothing, he decided to alter the Articles of the Company to carry out what he thought advisable. The following notice was therefore issued:—

THE ALLYNUGGER TEA COMPANY, LIMITED.

Notice is hereby given that an Extraordinary General Meeting of the abovenamed Company will be held at Winchester House, Old Broad Street, on Wednesday, the 1st day of November, 1899, at 1 o'clock P. M., for the purpose of considering, and, if thought fit, of passing the subjoined Resolution.

RESOLUTION.

"That the Articles of Association of the Company may be altered or amended so as to empower the Company in General Meeting, or by Extraordinary Resolution, to remove any Director before the expiration of his period of office and appoint another person in his stead, notwithstanding that such proposed Director shall not have held £500 or any of the nominal Share Capital of the Company for three months prior to such Meeting or Resolution, or at all, and notwithstanding that notice of the intention to propose such Director shall not have been given to the Company fourteen days previously to such Meeting or Resolution. The person so appointed to hold office during such time only as the Director in whose place he is appointed would have held the same if he had not been removed."

This notice is given in pursuance of a requisition to the Directors for that purpose signed by two shareholders of the Company holding in the aggregate one-tenth and upwards of the Capital of the Company and dated the 11th October, 1899. By order of the Directors McMEEKIN & Co., Secretaries.

10 & 11, Lime Street, London, October 23rd.

I was present at the meeting. Mr. McEwan caught sight of me and instructed the Secretary to request me to withdraw. But I informed that gentleman that I was there at the instance of Mr. McMeekin, and that answer seemed sufficient for Mr. McEwan. There was an attempt to exclude the press, but Mr. McMeekin over-ruled that, and a full account of the proceedings will doubtless reach Ceylon from other sources. There was an explanation from Mr. McMeekin as to the reasons for his action, and in the finish it was apparent that he was anxious to remove the Company's business from sheltering under the wing of Messrs. McMeekin & Co. any longer, and accepting other arrangements for the Company's business offices and secretarial work. The proceedings were brought to a close by a show of hands, which resulted in the resolution being lost, 9 being in favour of it, and 13 against it. But a poll was demanded, and, unless Mr. W. L. Watson, the Chairman of the Company, and Sir Alexander Wilson, can arrange in the meantime a *modus vivendi* the Secretaryship of its largest Company will in a week be lost to Messrs. McMeekin & Co., and once more those who have the right to have the largest voice, *viz.*, the largest shareholders, will have asserted themselves.

ALLYNUGGER TEA—THE QUESTION OF MANAGEMENT.

(*Financial Times*, November 2nd.)

An extraordinary general meeting of the Allynugger Tea Company, Ld., was held yesterday at Winchester House, for the purpose of considering the passing of the following resolution:—[quoted above.]

At the commencement of the proceedings the representatives of the press were refused admission, but eventually they were admitted on the motion of Mr. T. D. McMeekin. Mr. Ernest Tye presided. Mr. T. D. McMeekin moved the adoption of the above resolution. Mr. John Bartlett, in seconding the motion, said that, as Mr. McMeekin's circular to the shareholders had made no reference to the reasons which had actuated him to bring the drastic resolution before the meeting, he would proceed to do so. Every attempt had been made to arrange matters amicably without adopting the present course. Mr. McMeekin's circular had been met by one emanating from the directors, which contained statements to the effect that the secretaries, whom Mr. McMeekin wished to be removed from office, had given every satisfaction to the Board; that Mr. McMeekin, without formal notice, moved a resolution requesting their resignation, and that it was not in the interests of the preference shareholders to allow the control of the business to pass away from independent directors into the hands of the vendor. Mr. Bartlett informed the meeting that one of the secretaries acted as a director of the company also, so that there were really only two independent directors. As far back as the previous August Mr. McMeekin, in the interests of the preference and ordinary shareholders, intimated his wish that a re-arrangement should be made in connection with the secretarial duties. McMeekin's proposal was met by a resolution to be proposed at a Board meeting practically making the appointment of secretaries permanent for three years, and increasing their remuneration. Considering no ordinary dividend was paid in 1898, he thought the time was hardly propitious for such a proposal. However, that resolution was eventually withdrawn. Mr. McMeekin and his family held all the ordinary shares and a considerable proportion of the preference shares. Therefore, they would realise where the shoe pinched when there was no dividend for the year 1898. Mr. McMeekin had to consider his position in common with the other shareholders, and also how the company could be bettered. As managing director, Mr. McMeekin had received no remuneration since the formation of the company in 1892, although he only agreed to do so down to the end of 1896. Mr. McMeekin had provided money for the benefit of the company amounting to £20,000, and he had at different times sent out his two sons, who were skilled in the business, and an engineer to the estates at his own expense. All the money has been found without interest. In addition, Mr. McMeekin had acquired for the company an estate of 500 acres and fitted it up. Therefore, he thought Mr. McMeekin's position with regard to the company was one which entitled him to some consideration and voice in its management.

POSITION OF THE COMPANY.

Dealing with the position of the concern, Mr. Bartlett said that only 3 per cent was paid on the ordinary shares in 1897, and no dividend at all in 1898. One of the reasons why the secretaries should be removed from their present position was that, as tea dealers, their interests were somewhat conflicting with those of the company as tea producers, and in this connection their views on the recent agitation in the tea trade regarding the 1-lb. draft allowance were opposed to the company. Mr. McMeekin had arranged that a firm of tea importers should take over the management of the company, and in this way a saving of at least £400 a year would be effected; the markets would be carefully watched, and the tea would be sold in India and in London to the best advantage.

Mr. WATSON (Chairman of the Company) stated that Mr. McMeekin was managing director and vendor of the company. Sir Alexander Wilson and himself were appointed on the Board to represent outside shareholders, and consequently they felt themselves in a peculiar position. Until the present meeting he had had no idea what the row was about. No one, he thought, would expect the directors to have dismissed their secretaries, who had done the work of the company from its inception to the satisfaction of the Board, without sufficient reasons. On the 11th October Mr. McMeekin offered to give him the reasons privately, but he refused to listen unless they were disclosed at the same time to Sir Alexander Wilson. He had heard of no differences between the managing director and the Board with the exception of those regarding the secretaries. By his generosity Mr. McMeekin had no doubt strengthened the security of the preference shareholders, but they must not forget that all the profits after the payment of the preference dividend went into Mr. McMeekin's pocket. The proposed alteration to the articles of association was most objectionable, inasmuch as it would give one man the control of the company. Hear, hear.) If the meeting agreed to the proposition he should immediately retire from the directorate.

Sir ALEXANDER WILSON said he endorsed every word Mr. Watson had uttered. Should the resolution be adopted it was also his intention to resign his position on the Board. (Applause.)

SPEECH BY MR. MCEWAN.

Mr. McEWAN (one of the company's secretaries) contended that no effort had been made to effect a compromise regarding the matter

before the meeting. Mr. McMeekin asked him to retire from the company, and he (the speaker) naturally asked for a reason. Mr. McMeekin, however, insisted upon his immediate compliance with his request. Mr. McEwan replied that the question ought to be referred to the Board. As to the fact that Mr. McMeekin had drawn no remuneration, the speaker remarked that he agreed to take no salary to the 31st December, 1896. Had he drawn any since that date he would have lessened the benefits accruing to the ordinary shareholders (Hear, hear.) Mr. McMeekin must have known of the alleged conflicting interests of the secretaries and the company when the undertaking was formed, as there had been no change since then. Every pound of tea produced by the company was put up by public auction. Referring to the 1-lb. draft question, Mr. McEwan stated that his interests were similar to those of the company. (Hear, hear.) From the beginning he had devoted the greatest possible attention to the company's affairs, and he had been in close touch with the management in India. A dismissal of the kind put forward by Mr. McMeekin carried with it a suggestion of fault.

Mr. Seton thought the question of conflicting interests was an open one, but he desired to know if Mr. McMeekin, as managing director of the company from the commencement, was aware of the evil position in which Mr McEwan stood, and, if so, why he had not warned the shareholders before? (Hear, hear.) Did Mr. McMeekin approve of and allow the appointment of Mr. McEwan as director?

Mr. McMeekin: I was absent at the time.

Mr. Watson said that Mr. McEwan was appointed a director to a large extent for convenience. Although Mr. McMeekin was not present he acquiesced in the appointment. At any rate he never objected.

The resolution was then put to the meeting, and defeated, nine shareholders voting in its favour and fourteen against.

Mr. Bartlett handed in a demand for a poll.

The Chairman announced that the poll would be taken on Wednesday, the 8th instant, at Winchester House, at 1 o'clock.

The proceedings then terminated.

MARKET REPORT.

[*Per Mail Advices of 10th November* 1899.]

COFFEE.

The London Commercial Record says:—Supplies at auction have been only moderate, and with a continuance of the good demand the greater portion found a ready sale at full prices to a further advance of 1s to 2s per cwt. for all desirable qualities, all growths participating. A good export enquiry materially assisted the advance. "Futures" active, and prices have steadily advanced owing to smaller receipts; the tone at the close is strong at 1s 6d rise, viz.:—

London ...	... Santos ...	December delivery ...	31s. 3d.
New York	... No. 7 Rio...	„ „ ...	5·60 cents.
Hamburg...	... Santos ...	„ „	30¾ pf.
Havre ...	... Santos ...	„ „ ...	37½ francs.
Holland ...	... Good ordinary Java ...	...	30 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

TEA.

CHINA.— Common grades of Congous are a trifle cheaper, whilst other qualities maintain previous rates fairly well. Auctions have experienced a moderate demand, a fair proportion of the 4,536 packages catalogued during the week selling as under:—New season's: Moning 7d, Ningchow 6½d to 8½d, Oolong 8d to 9½d, Kaisow 6d, Scented Orange Pekoe 11d, Scented Caper 6¼d to 7d. Old season's: Formosa Oolong 6¼d, Souchong 9d per lb. Green tea—new season's Gunpowder 7½d to 1s 2d, Foong Mee 9½d to 1s ½d, Sow Mee 7d to 10d, Young Hyson 6¼d to 7¼d. old season's Gunpowder 5½d to 7¼d, Imperial 4d to 5d.

INDIAN.—Auctions were rather heavier, amounting to 50,200 packages, against 48,000 packages the week before, and 50,000 packages at this period of 1898.

A firm tone prevailed for nearly all descriptions, but enquiry was still chiefly concentrated on teas for price, which were occasionally fractionally dearer. Medium grades passed irregularly, particularly in the case of Broken Pekoes from 8d to 1s per lb., quotations for which were in many instances lower. Finest and tippy lines, however, ruled steadily.

The selection offered was generally of a useful character, most of the districts being represented. Some of the Darjeelings were not so well competed for, as the quality was considered to be inferior to that of prior consignments from the same gardens.

For 36,900 packages on Estate Account 8¾d per lb. was realised, compared with 8½d per lb. for 34,600 packages, and 9d per lb. for 41,800 packages in the two preceding seasons.

Business from here with foreign markets is assuming importance, the export for October being over one million lbs.

Telegrams from Calcutta state that 6a. 3p. per lb. was obtained there for 20,000 packages on the 31st ultimo, and that 22,000 packages have been declared for to-day.

CEYLON.—Public sales were large, totalling 27,800 packages, contrasted with 22,400 packages on the former Tuesday, and 17,900 packages a year ago. There was strong bidding for Pekoe Souchongs and Pekoes under 7½d per lb. for Home and Continental requirements, with at times a slight upward tendency. Broken sorts at a similar range also sold well. Pekoes and Broken Pekoes above that were not so much sought after and were often easier, but choice flavoured parcels brought full figures, the following being among the Best Broken Orange Pekoes:—Dimbula, 1s 7d; Goatfell, 1s 6½d; Talawakelle, 1s 6¼d; Troup, 1s 5½d; Gonamatava 1s 4¾d; Concordia, 1s 4¼d per lb.

The average is 8¼d per lb. On the 2nd instant it was a little under 8½d per lb., and 8⅝d per lb. on the 10th November, 1898.

The quantity sent from London to abroad during the past month again marked an increase on that of the same time in 1898.

A Colombo telegram to the Ceylon Association corrects the one previously received, and gives shipments to the United Kingdom for October as 8¾ million lbs., making the total from the 1st January to 31st ultimo 86 million lbs. instead of 84¾ million lbs. as then advised. The revised estimate for November is reduced to 7½ to 8 million lbs.

JAVA.—About 2,300 packages of direct import were included in the catalogues. Several of the invoices showed more desirable quality and the offerings were taken up readily, prices as a rule going against buyers.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

	Lbs.
From 1st to 7th Nov., 1899	4,682,494
Do. do. 1898	4,550,737

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	44,179	6,054	50,233
Ceylon	25,810	2,000	27,810
Java	2,085	288	2,373
Total ...	72,074	8,342	80,416

Also 15 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 10th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1899-1900	687,965	557,529	28,185
1898-1899	685,134	550,155	21,456

50,535 *pkgs.* INDIAN
28,804 „ CEYLON
2,373 „ JAVA
} Total 81,712 packages were offered in public auction this week.

The United States and Canada took practically the same quantity of British Grown Tea during the first nine months of the present year, as during the same period in 1898; this cannot be considered otherwise than satisfactory, taking into consideration the numerous circumstances which have recently disturbed the Tea trade, and especially the rise in the value of low priced Teas.

INDIAN.—The demand for Teas up to 7½d per lb. noticed last week has become decidedly stronger, a further advance of about ¼d per lb. having taken place. The better grades of medium Tea, especially broken kinds, remain comparatively cheap. The following averages are worthy of note:—"Poobong," 1/3; Amal T Est. Co. Dooteriah," and "British Darj. Co. Pussimbing," 1/2¼.

Week's av. of Tea sold on Garden Account 1899, 36,998 pkgs., av. 8·64d. 1898, 38,331 pkgs., av. 8·15d.

Total Tea sold on Garden Account 1st June to date 1899, 501,852 pkgs, av. 8·59d. 1898, 483,054 pkgs., av. 8·63d.

CEYLON.—The strong competition noticed last week has been again very pronounced, Teas up to about 7½d being slightly dearer, while the demand for other kinds continues steady, medium Broken Pekoes being perhaps the weakest market. A corrected official wire has come from Ceylon giving the exports during October as 8,750,000 lbs., against 6,500,000 last year, making the quantity from 1st January to end of October 86,000,000 lbs., against 81,000,000 lbs. in 1898, and giving the estimate for the current month as 7½ to 8 million pounds. The following averages may be mentioned:—"Carolina T. Co. Goatfell," 1/2½; Gen. Cey. Est. Co. Gonamatava" and "S. T. Co. St. Leonards," 1/0¼; "Nuwara Eliya T. Co. Concordia," 1/-.

Average for week 8·25d., against 8·51d. in 1898.

Ceylon Tea sold on Garden Account 1st January to date 1899, 937,158 pkgs., av. 7·98d. 1898, 979,073 pkgs., av. 7·72d.

Java.—The selection brought forward comprised a large quantity of useful liquoring Teas, mostly grown from Assam seed The auctions passed with good general competition and a distinct rise on prices quoted a fortnight ago, no sales having taken place last week.

COCOA.

A generally firm but far from active market showed itself at the auctions on Tuesday when of 2,477 bags catalogued barely 800 bags sold. Of 1,323 bags Trinidad offered about 370 bags were placed at 72s 6d to 76s for middling to fine, or barely up to expectations. Grenada was well held, and of the 344 bags brought forward very little more than 100 bags sold, but at an improvement of 1s per cwt., *viz.*: good to fine 65s to 68s, common to fair 62s 6d to 64s. 26 bags Dominica found buyers at valuations—common to fair 61s to 62s 6d. 8 bags common St. Lucia brought 61s. 6 bags Jamaica retired. 29 bags common gray Bahia realised 58s 6d. Guayaquil attracted little attention, only 60 bags selling, out of 1,255 bags exposed for competition, at 68s 6d for good Caraquez and 62s 6d for small. 71 bags Colombian, 329 bags Venezuelan, 131 bags Samana, and 151 bags Java all passed the hammer unsold. Good qualities of Ceylon were held above market ideas, and of the 770 bags of this growth offered 250 bags of Native were all that sold; these realised 54s to 62s 6d per cwt., which shows a tendency to ease. Private sales include—130 bags Samana at 60s to 61s, small lots of Puerto Cabello at 77s 6d up to 106s 6d, 800 bags Native Ceylon at 55s to 62s, some fine African up to 64s 6d, and 500 bags Guayaquil—Arriba 69s to 72s 6d, Caraquez 66s to 68s 6d per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—The market this week has been strong in tone, but business has not been large, owing to the fact that holders have raised their pretensions. In all about 150 tons have changed hands, including fair Singapore on the spot at 5¾d to 5 13/16d, January-March shipment at 6 3/32d, February-April shipment at 6 3/32d to 6⅛d, and April-June at 6 3/16d per lb.

Auctions on Wednesday offered 16 bags Singapore and 223 bags Penang, which retired unsold at 5⅞d and 5½d per lb. respectively. 141 bags shells and dust sold at 2⅜d to 2½d for the former, and 1⅞ to 2d per lb. for the latter.

To-day the market is firm, with fair demand on the spot at 5¾ for Singapore; February-April shipment offered at 6⅛d, and October-December at 5 5/16d.

White.—A very quiet market since our last without alteration in values. Singapore has been sold on the spot at 8 3/16d for fair, and 8 3/32d for near at hand, and at 9d for October-December shipment. Penang October-December shipment done at 8 9/16d per lb.

At public sale on the 8th instant, the exposure consisted of only 6 cases 1 bag Singapore—the bag sold at 8½d, the case—very bold quality—were bought in at 1s per lb.

GINGER.

Cochin.—Buyers have had to give in to the firm attitude maintained by holders, and have submitted to further rises in value. Cut kinds. and the really good grades of rough and washed Gingers have benefited most f.a.q. washed moving somewhat sluggishly. Still, buyers are fighting every inch of the way. and are only placing orders for small quantities. Catalogues comprised 158 cases 785 bags, of which 36 cases 45 bags sold in the room; medium some small, roughly cut and scraped realised 56s 6d, good small cut 37s 6d, and ordinary dull wormy medium and small washed rough 23s per cwt The private sales include 500 bags good Calicut sorts up to 30s, and fine bold as high as 35s per cwt., showing about 2s rise.

Jamaica.—Hangs fire, but little, if any, change can be noted in values. 26 barrels offered and 11 barrels ordinary dull washed sold at 51s 6d per cwt.

INDIA RUBBER.

The market for fine continues very strong and considerable business done at higher prices. Sales of hard cure spot and near delivery 4s 5½d to 4s 5¾d, Bolivian also at 4s 5½d for fine, and 4s 4½d entrefine. Soft cure, sales of fine spot and forward delivery 4s 3½d to 4s 4d, closing with few sellers. Cameta Negroheads.—Sales of a year old at 3s, and new spot at 2s 9d. At auction to-day there was good competition, and most part sold at rather higher prices, though some lots of West Indian scrap and slab went very cheaply.

QUININE.

Quiet, with a gradually declining market in second-hands until to-day; 1s 1¾d per oz. is quoted for December, and 1s 2d for March delivery.

On November 3 one of the leading local Amsterdam papers (*Handelsblad* published a telegram received from Batavia, that during 1900 five auction of Java quinine instead of one will be held at Batavia. The auction which was to be held on January 31 1900, has been postponed until February 28 and March 1. 1900.

(Average for all India 8·64d.), November 10th.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 15th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *6th December.*—*Weather.*—Two or three dull days last week, on one of which there was a slight drizzle. It is dull again this morning. Rather more chill lately. A cutting wind has been blowing. *Plant-diseases.*—Parts have had another touch of "leaf"; but coffee is looking magnificent. *Crops.*—Nearly all in! They will be shorter than was expected. *Labour.*—Plentiful; some places will pay off on 15th current: others at end of month. This establishes a "record" for dispensing with coolies. The price of grains reached famine rates on the 26th ultimo. *Ragi.*—10 to 8 seers per rupee. *Rice.*—7½ seers per rupee. This caused a riot at Siddapur Shandy on the same date, and there was some looting.

BRAZILIAN EXCHANGE.

In our last issue we wrote upon the subject of Currency and Coffee in Brazil, with particular reference to Coffee. We now propose to follow up those remarks with further comments on Exchange. Again referring to the report of the Brazilian Minister of Finance, we start with his assertion that the origin of the superabundance of both currency and coffee in Brazil was "exaggerated emissions of paper-money" and that these "laid the foundations for the development of of speculation, so powerful a factor of depreciation." The figures showing the increase of such emissions are referred to by Dr. Murtinho as representing "the ladder of economic and financial decadence that the Republic was obliged to

descend during the very first years of its existence." He gives the following tables to prove his arguments :—

Comparative Statement of Paper Money in Circulation.

1898 ...	7 3/16	33$391.304	814.301:311$950	216.848:439$373	24.386 628

The first thing to be observed, he remarks, is that depreciation began to be noteworthy since the very first emission under the Republic, and that it became progressively accentuated as new emissions were effected, reaching its maximum in March 1899, three months after the withdrawal of paper money was initiated.

If exaggerated emissions cause depreciation, withdrawal of paper currency should certainly tend to cause appreciation. On this point the Finance Minister remarks that the price of gold and of paper, like that of every object, is determined by the law of supply and demand and must be a ratio of one to the other, that, reduced to its most simple expression, is represented by a single quotient. In such conditions the price of our paper-money should be represented by the £24,500,000 divided by 735,000:000$, *i.e.*,

$$£\ \frac{24,500,000}{735:000\$000} = \frac{5.880,000,000}{735:000\$00} = 8d.$$

Reckoning thus, he asserts that if exports be maintained at the same value as last year the rate of exchange will oscillate about 8d., above or below. He further expresses the conviction that even with the same value of exports, 24 1/2 millions sterling, and independently of any importation of gold from abroad, should no political causes of depreciation supervene, exchange will rise to 9, 10, 12 and 15 pence as soon as the volume of the currency be reduced to 650, 580, 400 and 390 thousand contos. This is a view entirely at variance with those of Messrs. W. H. CROSSMAN & BROTHER, cited last week, and with those of the *Brazilian Review*. That contemporary quotes the Finance Minister's report as confirming its assertion that the funding loan afforded no absolute relief to the market in form of remittances compared with the previous year, as almost precisely the same amount is being now remitted as during the preceding year, and adds :—"If, therefore, there is a real improvement of nearly 1 1/2d since May 1898, it cannot be attributed, except indirectly, to the funding loan, but to some other real cause of improvement in the balance of payments, such as the reduction in the volume of the currency, or the reaction to the hopelessly bearish speculation that culminated in May 1898 after having forced rates, as speculation always does, much lower than they would have otherwise gone." It is worth while to compare these observations with Dr. MURTINHO'S comment on the rise of 2d. in exchange since April 1899. It is pretended, he says, that this cannot be attributed to the withdrawal of currency because the rate of exchange rose even more without the withdrawal having been even commenced. Examining this, he says that the causes that, immediately following that funding arrangement, determined the rise of exchange, were treble :—First, the belief in a great alteration in the position of takers in the market ; second, the bull speculation that always accompanies such an operation ; third, the extra-commercial intervention that artificially augmented the supply. The first cause, he asserts, disappeared entirely, as Government continued to take two millions sterling as it did previous to the funding agreement, during the fiscal year, June 1897 to June 1898, when, in consequence of the funds realized by the sale of the Leopoldina Railway debentures of the Western União loan, and sale of the cruisers *Amazonas* and *Almirante Abreu*, as also from the rental of the Uruguayna Railway and the £2,000,000 loan in London the amount of exchange taken by Government did not reach two millions. The second cause has also ceased, it being impossible to deny that at the present the tendency of speculation is for the fall. The third, in its turn, has also disappeared, as it is notorious that no extra commercial influence has been exercised by Government upon exchange to provoke an artificial rise. The causes, therefore, having ceased that provoked the improvement of exchange succeeding the funding agreement, the market should have reassumed the aspect previous to that agreement ; that is, exchange should have returned to 5 5/8d., had not the measures adopted by the Government produced positive and beneficial results. Of these measures, the most important is unquestionably the withdrawal of 50,000 contos paper-money.

We quote the above to show the arguments that the Brazilian Finance Minister adduces in support of the currency

policy of his Government. His hopes may be too sanguine, but his intentions are unmistakable. Realising the dangers attendant upon violent fluctuations of exchange, he advocates cautious and gradual withdrawal of paper-money, while, as regards the general financial policy to be followed, he says that the reduction of expenditure in every branch of the administration to a level with the country's impoverished resources; excise duties to correct a vicious industrial organisation; and the collection of part of import duties in gold to correspond to the exchange market, to which an enormous mass of depreciated paper communicates an unhealthy hypersensitiveness, constitute the mechanisms by which the financial organisation of Brazil must be adapted to the economical.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The U. P. A. Paris Exhibition Fund now stand as follows :—

Subscribers.	*Rs.*	*a.*	*p.*
Government of Madras	7,500	0	0
U. P. A. Reserve Fund	1,500	0	0
Binny & Co., Madras	100	0	0
Arbuthnot & Co., Madras	100	0	0
A. J. Saldanha & Sons, Mangalore	100	0	0
T. Stanes & Co., Coimbatore	100	0	0
Morgan & Son, Mangalore	100	0	0
Central Travancore P. A.	751	8	0
Wynaad P. A.	645	0	0
South Mysore P. A.	247	8	0
Shevaroy P. A.	200	0	0
Nelliampathy P. A.	100	0	0
	Rs. 11,444	0	0

* * *

The Government of India has asked the various Local Governments and Administrations for information as to any Indian exhibitors to the forthcoming Paris Exhibition and their exhibits. Such information is to be furnished in the form of a list, which may be briefly shown as follows :—

TEA EXHIBITS.

No.	Name of District.	Selection of Estates.	Commercial Teas.	Fancy Teas.	Green Teas.
1	Ambagamunda ..	District Planters' Association.	1	..	..
2	Badulla ..	Do.	1	..	..
3	Balangoda ..	Do.	1	..	..
4	Dikoya ..	Do.	2	1	..

Name of estate should also be given, though the list referred to gives none, as "the names of the actual estates for which the samples are to be furnished are not yet available."

* * *

The Secretary, U. P. A. S. I., would be glad to have early intimation from private exhibitors or District Associations as to all samples likely to be furnished, so that he may give Government the information desired, and make all necessary arrangements for despatch, &c.

* * *

The Book of Proceedings, 1899, is about to issue from the Press, and orders should be registered at an early date.

THE IMPROVEMENT OF QUEENSLAND COFFEE.

Some little time ago we referred to a suggestion that had been made in Queensland that no local coffee should be allowed to leave the district until it had been examined and approved as up to standard. The matter was discussed at a Committee Meeting of the Cairns Coffee Growers' Association on the 26th October, and apparently the discussion was lengthy. It was eventually resolved to send a letter to the Minister for Agriculture requesting that Mr. Newport's services might be placed at the disposal of those persons who were shipping coffee, to examine the same when ready to be exported and give a certificate in the event of its coming up to the standard. This examination was, however, to be made only at the request of growers, and to apply to both cleaned coffee and coffee in parchment. Mr. Newport, who was present, said he did not anticipate there being any difficulty in getting the request of the coffee growers acceded to by the Minister. The opinion was expressed at the meeting that by a system of inspection and issuing of certificates not only would the growers obtain a better price for their coffee, but they would also become more careful in their preparation of coffee for shipment. The steps being taken by the Association were not so much in the interests of Queensland buyers, who could easily find out the quality of the coffee, but were intended mainly to refer to coffee that was exported to other places. The great aim seems to be to acquire, and then to maintain, a first-class reputation for Queensland Coffee. It is too late to lock the Indian stable-door now, but we cannot help feeling some regret at the thought of what "might have been" had a similar inspection of Indian Coffee been started years ago and the exportation of very inferior sorts prevented. At the same time, Queensland growers are not *bound* to have their coffees inspected, nor is it said what will happen if crop presented for inspection should be considered below the standard fixed for "a pass."

By the way, it was stated at the meeting referred to that Mr. Howard Newport's services are available for showing farmers how to train and cultivate coffee trees. The *Argus* says :—"To obtain his services it is necessary, however, that a written application should be sent to him, addressed to the Kamerunga Nursery. Upon receipt of such, he will be pleased to instruct any coffee grower in the methods of cultivation he should adopt."

THE USE OF FERTILISERS.

A writer in *American Gardening* recently commented on a case brought to his notice, in which a plot of land that had been manured yielded a smaller crop than one that had not been manured. He expressed the belief that the application of the coarse manure had so affected the soil—which was very porous and especially subject to injurious effects of drought—as to cut off to a considerable extent the rise of water from below, and thus on the plots where manure had been applied, the crop suffered more from lack of moisture than did the crop growing on the plot where no fertiliser has been applied. He drew the conclusion that under certain conditions and in certain seasons heavy applications of barn manure may temporarily decrease rather than increase the product. The fertiliser was in each case applied to the surface and then ploughed under. The writer now quoted remarked :—"We

are coming more and more to believe that the place for the application of manure is as a top-dressing after the ground is plowed, rather than to apply it before plowing. There may, however, be many exceptions to this rule, especially would this be true on lands which are somewhat compact, as heavy clay soils. Here marked benefits may be produced by plowing under the manure, the beneficial effects being due, possibly, more to the physical than to the chemical action. The results which have been noticed from the application of barn manure are very frequently also noticed where commercial fertilisers have been applied." If when a manure is applied the crop is diminished rather than increased, then the inference would be that *that* soil does not (for that crop) need the fertilisers applied ; and it is added :—"The lesson which should be drawn from the experiment is that where thorough tillage is given the soil, there is less need for the application of fertilisers. That on light and somewhat porous soils the coarse manure should be applied as a top-dressing rather than plowed under."

TOBACCO.

Several of our friends having asked us to include Tobacco cultivation within the scope of our remarks, we have decided to issue a few papers on the subject. Unfortunately, there appears to be no *scientific* culture of tobacco in this country, so we must seek much of our information abroad. Again, Tobacco is peculiarly a plant in regard to which theory cannot be fully relied upon. If, therefore, our remarks from time to time are somewhat discursive, and seem to reflect hesitancy or doubt, we must ask our readers to bear in mind that this is because lessons from other countries cannot be safely applied in India without modification, and that our aim is simply to throw out a few suggestions in the hope that practical experiments may result and that useful information may be elicited from experimentalists.

I. Hints from the United States.

In the following, our first, paper on Tobacco, we rely entirely on a bulletin by Mr. M. Whitney, Chief of the Division of Soils of the U. S. Department of Agriculture. This gentleman displays considerable caution.

CLIMATE.

There is not sufficient difference in the meteorological conditions in the different regions, as ordinarily recorded, "to explain the distribution of the different classes of tobacco, yet this distribution is probably due mainly to climatic conditions. . . . One must still judge, so far as the climate is concerned, mainly from the experience of others as to the class of tobacco to be raised, as the ordinary meteorological record will be of very little value in determining this point. The plant is far more sensitive to these meteorological conditions than are our instruments." Even in such a famous tobacco region as Cuba, tobacco of good quality cannot be grown in the immediate vicinity of the ocean or in certain parts of the island, even on what would otherwise be considered good tobacco-lands. This has been the experience also in Sumatra and in our own country, but the influences are too subtle to be detected by our meteorological instruments.

Little, therefore, can be said at the present time in regard to the suitable climate condition for tobacco of any particular type or quality.

SOIL.

Next to climatic conditions, the class and type of tobacco depends more largely upon the character of soil than upon any other condition. Mr. Whitney reports and discusses mechanical analysis of a large number of samples of soil and sub-soil collected in the more important tobacco districts, and also gives records of determinations of the moisture content during several years "in one or two localities in some of the principal tobacco districts."

The results show that the cigar tobacco soils of the Connecticut Valley contain on an average considerably less than 5 per cent. of clay and maintain on an average about 7 per cent. of water throughout the season. These soils seem to be peculiarly adapted to a particular grade of wrapper leaf tobacco. A few years ago, when there was a greater demand for heavier cigars, these light soils had little or no value for tobacco. The tobacco lands of Pennsylvania, which are also devoted mainly to growing cigar tobacco, are confined chiefly to a comparatively narrow belt along the Susquehanna River and to limestone soils. The amount of clay in these soils varies from 13.8 per cent. in the river soils and shaly limestone soils 29.27 per cent. in the pure limestone soils. They maintain on an average about 18 per cent. of water, the amount rising to 22 to 23 per cent. in the heaviest limestone soils. The best wrapper leaf is produced on the lighter soils. Attention is called to the fact that a typical soil from the cigar tobacco districts of Ohio was found to contain 44.01 per cent. of silt and 27.52 per cent. of clay. It thus appears that the soils of this district are as heavy in texture as the limestone soils of Pennsylvania. During the season of 1897 they maintained a moisture content of a little more than 27 per cent It is probable that the mean water content of these soils in an average season would amount to about 23 to 25 per cent. of water. The tobacco grown under these conditions is used almost exclusively as a filler leaf. The Wisconsin tobacco is used both as a wrapper and filler leaf to some extent. It is grown on soils a typical sample of which was found to contain 36.05 per cent. of silt and 22.76 per cent. of clay. No determinations of the moisture content of these soils have been made.

The Cuban type of cigar wrapper and filler and some Sumatra tobacco are grown in Florida, although a new tobacco district is being opened-up in the region of Fort Mead, on the peninsula. The tobacco lands of western Florida are "a light loam about 12 inches deep, resting on heavy red clay, which is naturally well drained. The hammock soil of Fort Mead is, on the other hand, a very light sandy soil, extending down to a very considerable depth. The red sub-soils of western Florida contain about 30 per cent. of clay, but maintain on an average only about 8 or 10 per cent. of moisture. The hammock lands "contain on an average less than 4 per cent. of clay and less than 6 per cent. of silt, fine silt, and clay. They contain over 50 per cent. then 6 per cent. of silt, fine silt and clay. They contain over 50 per cent. of fine sand, so that they are relatively rather coarse and open. Notwithstanding this open texture (they contain an average 8 per cent. of water throughout the season, which is about as much as the tobacco lands of the Connecticut Valley contain. This water content, moreover, is for some reason more uniform, and the land can go for some time without rain with no serious injury to the crops. Nevertheless the planters have been greatly benefited by judicious systems of irrigations through over-head sprays

By thus keeping the plants continually and rapidly growing, the crop will mature in forty-five days from the time the plants are set out.

As regards Florida, Mr. Robert Sylvester, the Manager of Major A. Lewis' extensive tobacco plantation at Bonifay, in Holmes County, states that the best soil for tobacco is a grey sandy loam underlaid by a stiff red or yellow clay sub-soil; and a nature growth of hickory, oak, dogwood, and other hardwood varieties is a good indication of the best tobacco soil. Very good results have been obtained, however, on fine land; and there are successful growers who assert that they ask nothing better than pure pine land with a rich, yellow, loamy sub-soil, such as the orange-growers delight in. Mr. Sylvester claims that the best Sumatra can only be grown on virgin soil, while Cuban can be raised on the same land in successive crops, though it is always best to alternate the tobacco year about with a manure crop, as cow-peas, for instance.

The best fertilisers are cotton seed crushed and cotton-seed meal; the latter gives the plant a quick start; the former by its slower action to feed the plants at a latter period and sustain them during the important crises of leaf formation. About 80 to 100 bushels of crushed seed and 500 to 800 lbs. of the meal should be applied per acre.

"The bright yellow tobacco used for cigarettes, plug wrappers, fillers, and cutting is grown mainly in Virginia, North Carolina, South Carolina, and East Tennessee. The typical bright tobacco land consists of a loose, porous sand, containing not more than 8 or 10 per cent. of clay. This sand must be at least 12 inches deep. Many areas are cultivated in which the sand extends to depth of 5 or 10 feet or more, and a very fine quality of tobacco is produced."

The average of analyses of 44 samples of bright tobacco soils shows that they contain about 8 per cent. of clay. They maintain on an average about 7 per cent. of water.

Where the soils contain less than this the leaf inclined to be finer in texture and to have a better colour, but the yield per acre is small, and the most economical conditions on the whole are maintained by those soils having from 7 to 8 per cent. of clay and maintaining on an average about 7 or 8 per cent. of water. As the soil becomes heavier in texture and the amount of water increases other grades and types of tobacco are produced.

The manufacturing tobacco of Virginia and North Carolina is grown principally on the red clay soils located mainly on the gabbro, gneiss, and Lafayette clays. The sub-soils of these areas contain from 30 to 50 per cent. of clay, and, although no observations have been made on the moisture content of these soils, it is probable from observations made on adjacent soils that the mean water content is not far from 20 or 22 per cent. Since the introduction of White Burley tobacco the cultivation of the heavier types of tobacco has noticeably decreased in Virginia and North Carolina.

The White Burley tobacco is confind to the well-marked type of soil of the Lower Silurian limestone in central and north central Kentucky, and the adjacent countries of Ohio. This embraces the blue grass region of Kentucky, and it is upon these fine, fertile, blue grass soils that the White Burley is grown." The soils are all heavy clays of a uniform deep red colour. The sub-soils contain on an average abount 30 per cent. of clay. "The characteristic soil of the limestone areas of Kentucky, adapted to the White Burley tobacco, as the result of several years' investigation, may be said to maintain on an average about 20 per cent. of water."

Export tobacco is grown in Kentucky and Tennessee on silty soils which are quite fertile in character. These soils are derived chiefly from the St. Louis group of the sub-corboniferous. They contain from 40 to 60 per cent. of silt and 22 to 23 per cent. of clay, and maintain an average water content of about 15 per cent.

Mr. Whitney remarks:—"The methods of cultivation should have for their prime object the maintenance of the water-supply above the line of drought, so that the growth of the plant shall receive no check. If this cannot be done by the ordinary method of cultivation, irrigation must be resorted to upon such occasions, if the crop is to be maintained in its best condition."

NOTES.

Amsterdam Bark Market. The first Dutch sale in 1900 will be held on Thursday, January 11th.

Calcutta Tea Sales. The average of the tea sales of 24th ultimo was 35¼ cts. a lb. About 17,000 packages were to be offered on the 1st instant.

A Mycologist for Ceylon. Ceylon is to have a Mycologist. Lucky Ceylon! No wonder planters there clamour for all they want: they generally get it in the long run.

Tea Taring. A telegram, dated 27th ultimo, states:—The Customs have decided to suspend part of the order providing a new system of weighing tares for tea. The new arrangements do not, therefore, come into force on the 1st December.

The London Coffee Market. Reuter cabled on the 5th instant that the price of Mysore, average (B) size Coffee was 48*s*. Stock 16·481 tons, fortnight's landings 1,100; deliveries 2,200 tons. The offtake thus continues larger than receipts, and though the excess is not great enough to bring about any marked change in prices just yet. We are glad to note that 50*s*. is now quoted.

Hybrid Coffee. The *Revue Agricole* (Réunion) brings Hybrid Coffee to the notice of its readers, observing that there are no doubt some natural hybrids in the island already, and that in any case some planters should turn their attention to artificial hybridisation. Our contemporary writes in the belief that the knell of profitable coffee cultivation has not yet been sounded.

The Indian Tea Season. The following telegram regarding the tea crop for November has been sent by the Indian Tea Association, Calcutta, to the Association in London:—"Assam outturn last month was normal. The season is practically closed. Cachar outturn last month was normal. The season will close shortly. Sylhet outturn last month was poor. Duars and Terai outturn last month was poor. The season is practically closed."

The London Tea Markets. Cabling to Colombo on the 30th ultimo, Messrs. Gow, Wilson and Stanton reported that buyers were operating cautiously.

Fair liquoring Ceylon Pekoe Souchong was quoted 6¾d. (unchanged) average for the week 7⅝d. (¼d. down). Of 20,000 packages Ceylons offered 19,000 were sold, while 41,000 packages Indians found buyers out of 47,000 packages offered. The average price of Indian leaf was 8¼d. (⅜d. down).

The Paris Exhibition. The carving for the Indian Tea-house at the Paris Exhibition has now been despatched from Calcutta *viâ* Bombay, says the *I. P. G.* of the 2nd instant. The remainder of the consignments for the Indian Court are only delayed for want of the French Customs House labels, which were to be supplied through the Home Committee in London. The work has been carried through with remarkable celerity by the Indian Forest Department.

Cinchona Bark Auctions in London during 1900. It was stated at the cinchona auctions, on 14th ultimo, that the following list of dates had been proposed for the bark sales during the coming year: January 16th, February 20th, March 13th, April 10th, May 15th, June 19th, July 17th, August 14th, September 11th, October 9th, November 13th, and December 18th. In reply to a question, it was stated that these dates did not interfere with either the Dutch auctions or the Easter Holidays.

Coming down handsome. The Tea Trade Section of the Mincing Lane branch of the Lord Mayor's Transvaal Widows, and Orphans' Fund has, says the *Home & Colonial Mail*, made a hearty response to the call for subscriptions. Tea companies, growers, agency firms, importers, brokers, dealers, distributors, and warehouse-keepers are doing their best to swell the fund, which already reaches £8,000. The tide of subscriptions flows bountifully, thanks to the energy of those who are working in the good cause.

Tea and Cardamoms. An up-country planter writes to the *Ceylon Observer*:—"In your issue of Tuesday under Ramie and Cardamoms, your correspondent is quite right. Tea grows well where cardamoms have failed; but I have never heard of cardamoms growing where tea failed. I know of several small fields, formerly in cardamoms, now doing well in tea. A field which does not yield a paying crop in cardamoms should be planted up with tea, and it will probably give as good a yield per acre as any tea-field on the estate."

The British Tea Duty. A Ceylon planter has given notice of a resolution "That this Association considers that it is in the interests of producers to join action with the Indian Tea Association in agitating for the abolition of the English Import Duty on Tea when the time for such agitation be deemed advisable." The last few words manifest a desire on the part of the mover to "sit on the fence." It is largely because the present time is so inopportune that Ceylon and South Indian planters stand aloof from the agitation regarding abolition of British Tea duties.

Colombo Tea Sales. At the public sales of tea at Colombo on the 29th ultimo, about 10,986 pkgs. = 856,806 lbs. were offered, of which about 8,996 pkgs. = 707,342 lbs. were sold. A better tone was noticeable at the auction, and competition was good for all grades. Brokens ruled slightly firmer, and all leaf grades were in strong demand at previous rates. The *Times of Ceylon* states that good invoices were offered from Eastwood, High Forest, Gonapitiya, Harrow, Agra Ouvah, Glasgow, Glassaugh, and Mocha.

Producers and the Tea Market. "Suum Cuique," writing to a Colombo contemporary, observes that what producers ought to aim at by means of a combine is, first, to anticipate any possible further extension of power among buyers, or adverse differential action of Governments, by a unity of action among sellers; second, to gather such data of the extension of the cultivation of tea, etc., so as to provide information that, if rightly used, it cannot do otherwise than help to regulate production. We are very pleased to see the second remark. Accurate statistics are certainly desirable, whether there be combination among producers or not.

The New Tea Sale Room, Calcutta. The Calcutta Tea Brokers have at last found a definite resting place, says *Capital*. Sales have been held since the beginning of this season at the Metcalfe Hall, but as the Government of India gave notice that these premises would be required for the purposes of a public library, it became necessary to find a new sale room before the end of the year. A room of the required size was not easy to find, and eventually Messrs. J. Thomas & Co. made an offer, which was accepted, to erect a sale room for the sole use of the Tea Brokers' Association, at their premises, in Mission Row. The building has been entrusted to Messrs. A. & J. Main & Co., and will be used for the first time to-morrow, December 1st. A separate entrance has been provided at the corner of Mission Row.

Tea for the Troops. The Queen's Christmas gift of chocolate to each one of her soldiers in South Africa, which is to be put up in specially designed tins, reminds us, says the *I. P. G.*, that the Indian tea industry has a chance given it, once again, to retrieve its former omissions. "Why should not the Indian Tea Association, as representative of the Indian tea industry, *at once* arrange to send out to South Africa a present of 1 lb. of tea to each soldier, as (say) a *New Year's* gift? If specially designed tins could be prepared in time, so much the better, but we doubt if from 70 to 80 thousand tins could be got ready in time—this, of course, is a matter for contractors to decide. We trust the Indian Tea Association will see its way to immediately adopt the suggestion; for we feel sure there is not a single individual in India, in any way connected with tea or the tea industry, who will not most heartily respond to and second the proposal; and, if necessary, subscribe to a fund for its accomplishment. *Bis dat, qui cito dat.*"

Coffee in Coorg. In the report on the working of the Department of Land Records and Agriculture in the Province of Coorg for 1898-99 we read:—The deterioration of the coffee plantations in the Padinalknad taluk, which are, with one exception, all held by natives was very marked. At the Commissioner's request the Chief Commissioner in February kindly altered the programme of his tour so as personally to visit this portion of the district, which is a very outlying one on the Western Ghâts. As a result of his visit he directed the suspension of half of the coffee assessment of the deteriorated estates and ordered that they should

be thoroughly examined and a report made of them, which was since done. In this taluk also are situated the cardamom males or forests from which cardamom is obtained. The price of this spice has gradually got lower and lower, probably from over-production elsewhere. With the failure of coffee and cardamom, their two chief means (after the rice crop) of livelihood, the ryots of this taluk (who, when they were prosperous, were remarkable for their extravagance and recklessness) are now steeped in the deepest poverty, and their condition causes considerable anxiety. Tea is being tried here as well as in Mercara, and, if it only succeeds, may save the situation.

The World's Gold Product.

The estimate of the world's gold production by George E. Roberts, Director of the United States Mint, makes the total world's output for the calendar year 1898 $287,428,600. The following comparison with United States Mint estimates of preceding calendar years is of interest :-

WORLD'S GOLD OUTPUT.

1898	...	$287,428,600	1892	...	$146,651,500
1897...	...	238,812,000	1891	...	130,650,000
1896 ..	...	202,251,600	1890...	...	118,848,700
1895	...	199,304,100	1889 ..	...	123,489,200
1894...	...	181,175,600	1888...	...	110,196,900
1893 ..	...	157,494,800	1887 ..	...	105,774,900

The principal gold-producers of the last three years have made the following output, in order of importance :—

	1898.	1897.	1896.
Africa ...	$80,428,000	$58,558,700	$44,581,100
Australasia ...	64,860,800	52,665,700	43,776,200
United States ...	64,463,000	57,363,000	53,088,000
Russia ...	25,463,400	23,245,700	21,535,800
British N. America	13,838,700	6,089,500	2,817,000
Mexico ...	8,500,000	7,500,000	6,500,000
British India ...	7,781,500	7,247,200	6,130,500
China	6,078,700	8,833,500	8,058,600

Side by side with the increased output of gold, there has been a general rise in prices of commodities. But, unfortunately, Tea and Coffee have been the exceptions to the rule.

The United Coffee Growers' Co.

According to a report in the *Madras Mail*, the Statutory Meeting of the United Coffee Growers' Company, Ld., was held in the Assembly Room, Coonoor, on Wednesday 29th November. A statement was placed by the Directors before the shareholders, in which they were informed that the land for the erection of the buildings has been acquired in Coimbatore, but the building will, it is hoped, be completed in from two to three months' time; that roasting, mixing, and grinding machinery, as well as a tin-making plant, has been ordered from the Continent, and is now on its way out. It is estimated that this machinery will be capable of dealing with 400 to 500 tons of coffee per annum, which amount, by the addition of another roasting machine, can be increased to 800 to 1,000 tons per annum, the engine-power and the tin-making machinery being sufficient for this additional output. The services of a gentleman who has been through a regular course of instruction in London and on the Continent have been secured. The Company has spared no pains to put itself into a position to place the best article on the market at the lowest price. A statement of the financial position of the Company was made by the Directors and was found to be in every way satisfactory. This being a Statutory Meeting, no other business was transacted. The Annual General Meeting of the Company was fixed for July, 1900.

Tea Reform and Dock Charges.

With reference to the comments on this subject which have appeared in the *Produce Markets' Review*, and which we have reproduced, that journal remarks that these comments have led to a good deal of criticism, especially on the subject of the dock charges. "Our figures," it says, "were compiled from the dock books themselves by one whose sole occupation it is to look after such matters, but the items are most obscurely given by the companies, and it is indeed impossible for any one except an expert to make head or tail of them. Our object was, however, to secure absolute accuracy, and as we find on close scrutiny that some of the items (notably the bulking and taring, in which, after reference, we believed we were right) are inaccurate we append a corrected statement of dock charges on Indian tea in this port, and a comparison of them with those on other goods. This comparison is the important point and not fractional differences in details. The errors detected by our critics, which we gladly correct, affect this comparison to the extent that we overstated the Indian tea charges comparatively 3s. 6d. per ton, they working out at 52s. 6d. instead of 56s. Warrants and weight notes were not included by us in tea, which would practically cover this small balance, but we are content to take the smaller figure. What possible reason can there be, except gross mismanagement and monopoly, for the charges on Indian tea being four times more than those on Indian Coffee? To satisfy our critics we now give the following corrected charges on one ton of Indian tea landed and sold at public sale, taking twenty chests to a ton : Landing and housing rate, at 1s. 6d. per chest, £1 10s.; public sale charges, at 4d. per chest, 6s. 8d.; bulking and taring each chest, at 1s. 5d. per chest, £1 8s. 4d.; and ten weeks' rent, at ½d. per chest, 8s. 4d.; giving a total of £3 13s. 4d. From this a discount of 10 per cent. is deducted, leaving a balance of £3 6s, and then again to this has to be added the charges for weight notes and warrant stamps, which are 8d. and 1s. respectively, thus giving a net total of £3 7s. 8d."

LETTERS TO THE EDITOR.

THE PROSPECTS OF COFFEE.

Recent advices from London seem to indicate that Messrs. Crossman & Co., in their letter of October 21st last, have not taken sufficient account of the effect of the increasing consumption. Messrs. Rucker & Bencraft write :—"Messrs. Duuring & Zoon's figures come rather as a surprise, the visible supply shewing a decrease of about 23,000 tons against an increase last year of 16,000 tons; the deliveries for the ten months total 725,000 tons, or at the rate of 870,000 tons per annum. With steadily increasing consumption, it is evident that the enormously increased production may before long be required: indeed, some think that consumption already begins to hold production. The market has advanced 5s. 6d. to 6s. from the lowest point, and a comparatively small improvement in the position may bring about a very considerable improvement: " 870,000 tons equal at 60 kilos. (132¼ lbs.) per bag, 14,790,000 bags, and the average world's crop for the three years of heavy crops 1897–99 averaged only 15,346,674 bags. Another 600,000 bags added to deliveries will bring the consumption up to the production, even if the latter remains at the high level of the last three years. The

present state of affairs in Brazil, recently set forth, does not allow of much possibility of an increase in production. No doubt, as Messrs. Crossman say, the curtailment of production depends entirely on constant lower prices for coffee. They seem, however, to overlook the fact that this is the third year of very low prices in Brazil, and the fourth since Brazil prices began to fall heavily. The crisis has apparently been staved off in Brazil by borrowing, as the papers think, of heavy mortgages on two-thirds of the plantations, and the impossibility of making even the best pay. The accumulating effect of these mortgages is now, however, beginning to be felt, and planters are driven to the desperate expedient of reducing wages to a point which is driving away the imported labour on which they depend to pick their crop. This will probably result in a curtailment of production, which may effect the improvement in the position Messrs. Rucker & Bencraft postulate. The tendency in Brazil, and nearly all coffee countries of late years, has been for the cost of production to increase largely, and there is little hope, under existing circumstances, of any material reduction in that cost, such as Messrs. Crossman predict. The accounts recently given in *Planting Opinion* of coffee-planting in Guatemala in 1898, when mild coffees had fallen only 15s. a cwt., do not leave much hope for profitable cultivation there: now prices have fallen another 30s. a cwt. The only coffee district in the world of any importance, from which glowing accounts of the prospects of coffee-growing come, is the Isthmus of Tehuantepec in Mexico; but this district has long been boomed by Yankees who have spent immense sums there, and the glowing prospects are based on an expectation that "The Americans are going to do with coffee in the Isthmus of Tehuantepec what they have done with fruit in California, that is, improve its quality and increase the production per tree." Increased production in most coffee countries means a deterioration of quality; but the Yankees can no doubt do what no others can! This account appears in *Planting Opinion* of the 11th November last, and is extracted from the *Mexican Herald*, which previously declared there was no profit on coffee-growing in Mexico at present prices, and that now, as fifteen years ago, when prices ruled low, a large acreage would probably be abandoned. Remembering how the Yankees boomed fruit in California and oranges in Florida, and how badly those who took over their openings in these countries did, we may well be sceptical as to the future prospects of Tehuantepec, except as a country for Yankees to make their pile out of the unwary greenhorn. At least Tehuantepec is the one solitary coffee district in the world with rosy prospects at present, and this being the case, a curtailment of production seems imminent, while consumption goes on increasing by leaps and bounds.

W.

THE FUTURE OF COFFEE.

No. II.

On the 2nd instant, the same day on which your last issue was published, *The Madras Mail*, always alive to the interests of planters, called attention to the fact that the visible supply of coffee had decreased by 23,000 tons, against an increase of 16,000 tons (at the same date?) last year. As the *Mail* says, these figures come as a surprise; but it is a surprise which, at first sight, most Indian coffee planters will consider a most agreeable one. For it seems to imply that the consumption for the past year has exceeded the supply. This is a more favorable (?) conclusion than the *Mail* ventures to draw; but it is not easy to see, on any other assumption, how the visible supply can have decreased. But supposing this is correct, and that the demand has indeed overtaken the supply, and even passed it—what does it mean? Is the consequent rise in price, what at first sight it appears, a real and unmixed blessing? Paradoxical as it may seem, I unhesitatingly answer NO. *The rise has come too soon.*

In my last letter I gave the result of some of Monsieur Conty's observations in Brazil, and it will be remembered that he asserts that several Sao Paolo planters permitted him to examine their accounts, from which it appeared that, when the milreis was at 8d., and the average value of their entire crops 31*s.* and 6*d.* per cwt., they were able to produce and lay it down in the Santos market for 14*s.* and 7½*d.* per cwt. That is omitting only interest on their capital, and the living expenses of the planter, they were able, with the milreis at 8d., to make something over cent per cent on their outlay. You quoted the milreis, on the 2nd instant, at 7⅛d. so, as the production is paid for in milreis and the coffee in gold, the cost to the planter would still be 14s. and 7½d., but the price he would get (disregarding, for the moment, the late rise) would now be 35s. and 4d. per cwt. If you deduct 6s. and 1d. per cwt. for living expenses and interest on capital, the planter would still have 29s. and 3d. per cwt. as the return on an expenditure of 14s. and 7½d., or exactly cent per cent upon his outlay. That is, of course, always supposing that Monsieur Conty's figures are to be relied upon; but no one who has read his paper can have any excuse for doubting that his estimates and conclusions are as accurate and reliable as any we are likely to get.

On the above assumption it is clear that, while the Indian planter is on the verge of ruin, the Brazilian is still "going strong"; and if, whilst the milreis continues to fall, the gold price of coffee commences to rise, the consequences must be disastrous to India. Brazil will be stimulated to further extensions (for the area suitable for coffee there is, practically, unlimited) till the supply again exceeds the demand sufficiently to bring about such a contraction in prices as to check speculation and over-production. The gain to the Indian planter would thus be short-lived and illusory; and I think these considerations justify my conclusion that the rise in prices has come too soon. What the Indian planter should most devoutly hope for is that the value of the milreis may be forced up till Brazilian producers are handicapped as heavily as we are. *Then* let gold prices go up as high as they will. Fighting the Brazilians on equal terms, Indian planters need not fear the issue. But as long as the milreis is at 7⅛d., so that they can get more than 33⅓ rupees (milreis) for every sovereign, whilst we can only get 15, may the gods avert a rise in prices! I would strongly advise my brother-planters not to be too jubilant over the present slight improvement in their prospects. Until the value of the milreis rises, I consider that it is worse than useless. I am, however, one of those who firmly believe in the policy of the Brazilian Government. The fluctuation of exchange, like the course of the weather, is exceedingly difficult to predict in detail; but, though some disappointment may be felt at the dogged persistence with which it

has held out during the last few months, absolutely refusing to rise, in defiance of the most natural expectations, there can, I think, be no more doubt of the ultimate result than there is about that of the Transvaal war. Meantime, we must set our teeth, and continue the unequal fight with a firm determination that we *will not* be beaten. As I said in my last, let us economise, as far as we possibly can, and raise any catch-crops that will help us a little to wait for the turn of the tide.

Englishmen are apt to despise their foes. It is a bad fault, and one that has often cost us dear. There is much that we can learn from the Brazilian planter, and the sooner we set about it the better it will be for us. Their wonderful crops, averaging—over enormous areas—3,300 lbs. per 1,000 trees, may well excite our surprise and admiration. In my next letter I propose to make further use of Monsieur Conty's admirable paper; and to indicate some of the lessons which, in my opinion, the Indian planter might profitably learn from his Brazilian rival.

Coffee Planter.

GENERAL ARTICLES.

BRAZILIAN EXCHANGE.

In connection with tables quoted in our leading article, we would call our readers' attention to the following remarks by the *Moniteur des Interêts Materials*. These remarks are interesting not only as showing that there are critics who observe matters from a very different point of view from that of the Finance Minister, but also because they have elicited some instructive comments from the *Brazilian Review*. That journal explains that since 1895 circumstances have changed greatly, and that even if it were true that coffee bills alone controlled exchange at that time it is certainly so no longer. Previous to 1896, coffee gave from £22,000,000 to £28,000,000, whilst rubber yielded only £5,000,000 to £6,000,000. To-day coffee gives only £14,000,000 whilst rubber yields £8,000,000 at least! Previous to 1896 coffee furnished 40% of all the bills: to-day it does not yield 20%!

The following is the article that gave rise to this criticism:—

The following table represents the minimum monthly course of exchange since 1895:—

VARIATIONS OF EXCHANGE.

	1895.	1896.	1897.	1898.	1899.
January ...	10 1/4	9 1/4	8 1/2	6 7 8	7 3 8
February ...	9 11/16	8 13/16	8 1/2	6 7/16	7 1/2
March ...	9 1/2	8 1/2	7 7/8	6 1 32	6 1/2
April ...	9 1/4	8 7/8	7 3/4	5 11/16	6 7 8
May ...	9 1/16	9 9/16	7 9/16	5 11/16	7 1/2
June ...	9 1/8	9 13/16	7 7/8	7	7 7/8
July ...	10 1 4	9 5/16	7 3/8	7 3/16	8 1 16
August ...	10 5 8	8 11 16	7 1 8	7 1/4	7 31/32
September ...	10 7/16	8 5/8	7 5/16	7 9/16	...
October ...	10 11/16	8 1/16	7 5/16	8 3 8	...
November ...	9 1/16	7 7 8	6 7/8	8 1/2	...
December ...	9 1/8	8 5/16	7 1/16	7 1/2	...

A curve representing these oscillations would show that in 1895 exchange fell from January to May from 10 1/4 to 9 1/16d., rose again in June, and reached its maximum, 10 11/16d., in October falling again in November and December until it again reached the May minimum.

This curve it may be said is regular.

In Brazil the influence of shipments of coffee commences to be felt in May, although not very important until the end of August, and sometimes until September. But from May onwards shippers usually begin to cover and secure their exchange.

This explains the rise that usually occurs between spring and autumn.

If in November, December and the first few months of the year following exchange rise, it is quite independently of the commerce in the great staple export of the country—coffee.

Sometimes in November some financial operation is finally realized that has been dormant during the vacation and produces an influx of gold. Whenever a loan or the sale of some property is projected the result is the same. But in 1895, we repeat, the curve was regular and in agreement with what should result from the commerce of coffee, with which, above all, it is necessary to reckon.

In 1896 exchange fell normally from January to March (9 1/4 to 8 1/2 d.), rose again to 9 13/16 in June, but to fall again to 7 7/8d. in November, the lowest rate then attained.

This, evidently, was the commencement of the final crisis that lasted to June 1898, that is, until the funding agreement permitted the Treasury to abstain from remitting gold for the service of the debt.

During that year the curve of exchange after having been normal, became irregular, being falsified by a special cause, the situation of the treasury, which operated outside the commercial situation.

In 1897 the crisis became serious: the curve disappeared; there was no longer any rise in summer, but only an almost uninterrupted fall from 8 1/2 to 7d.

This went on until May 1898, that is, until the moment that marks the determination of Government to compound with its creditors. The crisis, which became acute in January (6 7/8d.), reached its culminating point, 5 11/16d.

As soon as the conditions of the funding agreement were known exchange rose at once to 7d. and then to 8 1/2, variations that were, however, produced by causes other than the see-saw of the balance of trade.

From this date the regular rules are again applicable. In 1899 the rise commenced regularly in May (6 7/8d to July (8 1/16d) and August (7 31/32d.), the fall coming too in its regular time, that is, about September, as in 1895.

The only thing changed is the *minimum*: it was 5 11/16d in April 1898 and 6 1/2 in March 1899. Probably, barring extraordinary events, the margin that remains between the actual Autumn rate and the lowest (dead) point of next Spring will prove sufficient to prevent rates falling again to 7d.

Summing up, the study of these movements proves that Brazil has, independently of the effect that the withdrawal of paper money in accordance with the stipulations of the funding loan may produce, entered upon the period of rising exchange. As regards the effect of the withdrawal of paper money, this can only be very gradual, in view of the comparative insignificance of the notes destroyed.

When a spoonful of milk is taken from a jar the level does not appear to have changed at all, and so even two or more spoonsful may be removed without much alteration being noticed, but at last the shrinkage of a single spoonful, even, must become noticeable.

Theoretically, moreover, the volume of paper-money comprehends two well defined quantities.

1st. The quantity of paper or fiduciary money which a country requires for its internal transactions and is able to bear without depreciation or involving a premium on gold, even should the currency be "forced" and inconvertible, provided that foreign payments be balanced.

2nd. A second quantity, smaller or greater as the case may be, that has been violently put into circulation, and provokes depreciation by its very excess.

When withdrawals of paper money are effected it is upon this second quantity and on it only that the effect is exercised and not on the whole mass in circulation. Because theoretically the last fraction of the premium must disappear with the last excessive note, even should no gold stock have been accumulated meanwhile and the notes continue to enjoy forced currency and to be neither legally nor practically exchangeable for specie.

If, therefore, the effect of withdrawal be not immediately felt in Brazil, it must not be concluded therefrom that the process is deficient, until inroad have been made upon this *surplus*.

RUBBER.

Manicoba Rubber.—Large forests of Manicoba have been discovered in the Serra do Perreira, Ceará.

Mangabeira Bubber.—In the review of rubber plants which Professor V Warburg is contributing to the "Tropenpflanzer" he prophesies a great future to the hancornia speciosa, a tree which occurs in the central belt of Brazil, principally in the States of Bahia and Pernambuco, also in Goyaz and Minas-Geraes, San Paulo, and other Southern and Western States, and has indeed been found in Paraguay. The trees attain a height of 20 ft., and may in general appearance be likened to apple trees. In some districts they are so common that they give the characteristic stamp to the landscape. The fruit has the size of a plum, and is valued both raw and preserved. The rubber trees are on the whole very useful, and their fruits are often appreciated. When the tree has attained an age of five or six years, it may be tapped. The milk has a characteristic pinkish colour and the rubber, the coagulation of which is brought about by an addition of alum, is distinguished by the same colour. Originally the lumps were kneaded by hand and dried in the sun. The mass, which keeps its pink colour inside, while the outside turns brown, retained too much water, however, so that the rubber is now dried in thin sheets. These sheets command a good price; but the Professor is hardly correct in stating, as the *Gummi-Zeitung* points out, that it is valued as highly as Para rubber. Perhaps Warburg's account is a little optimistic; at any rate, the state of S. Paulo is encouraging the cultivation of the hancornia, and it may be quite right to introduce the tree in Togoland, although the climatic conditions of the South American continent and of the Gulf of Benin may differ widely. As there is little known about the habits of the tree, a further study in the home of the hancornia may be more advisable than experimenting.

Professor K. Schuhmann announces the identication of a new rubber tree of East Africa. It concerns the moga rubber tree of the Zanzibar trade. So far as branches and blossoms allow to determine, this product forms the mascarenhasia elastica, the special variety having been named after K. Schuhmann.

COFFEE-ROASTERS.

Some inquiry having been made in Queensland concerning coffee-roasting and preparation for market on the plantation, Mr. Howard Newport supplied the following account of a useful roaster. In a paper in *The Queensland Agricultural Journal* he says :—

Before going into this subject in detail, I would mention that the roasting and subsequent tinning, labelling, and retail selling of ground coffee do not seem to be worth the while of small coffee-growers.

The treatment of the coffee after it has left the huller, winnowing fan, and sizer is a business in itself, and would necessitate more attention and the expenditure of more time than a small grower would be able to spare for it.

I have not the space here to go fully into my reasons for thinking thus, but these will be mentioned in my report on the industry. While readily supplying the information, I do not advocate, as a general rule, the *manufacture* of coffee by the *grower*.

The Roaster.—A useful size of cylinder is 2 feet external length—which allows for the riveting in of the ends, 9 inches—about 1 foot 10 inches internal length, with about 12 inches diameter. To this is fixed a bar to act as axle, one end of which is bent to form a handle by which to revolve the cylinder. The bar may or may not go through the cylinder; it is often fixed to the discs at the ends merely, but it is difficult in doing this to have them so nicely and exactly fixed as to allow the cylinder to revolve evenly and truly. In any case, the fastenings should be by means of rivets, and not by any method of soldering.

The majority of coffee roasters have the bar fastened to the cylinder or drum, either run through it or attached to each end; but by far the most useful method is to have a piece of iron tubing inserted and riveted to the cylinder through which the axle bar can pass; the bar then having a collar attachment at one side to prevent the cylinder going too far back, and being fixed on to the axle by a flat piece of steel running in a shallow slot in the bar technically called a "key."

The axle bar should be about $\frac{3}{4}$ inch in diameter and about 7 feet long. This length is necessary to allow the cylinder being slipped along, as well as to allow the manipulator to work some little distance from the furnace. The tube running through the cylinder should be just large enough to run freely on the bar.

This method admits of the roaster being easily and quickly worked, since the cylinder can, by the removal of the fixing key, be slipped out of the furnace without the removal of the axle bar from its bearings.

The bearings need not be elaborate, or of brass, specially turned and fitted, though for constant work such would wear far better and last longer.

The door into the cylinder should be a sliding one, and need not be very wide; 4 inches would be enough. It should, however, run the whole length of the cylinder, and not for merely a portion of its length. This, with the cylinder, while still hot, is slipped along the axle bar and out of the furnace; a few revolutions will drop the contents into a receiving tray without handling, and a new lot may be put into the roaster, without having to wait for it to cool down.

The Cylinder should be made of 1/12 or $\frac{1}{8}$ inch iron; 1/16 inch will do, and roast quicker, but will not last so long, and is more liable to warp in the heat. The lid should be of the same material. Inside the cylinder there should be five or six strips of 1/16 inch iron, about 2 or $2\frac{1}{2}$ inches high, riveted along the sides at right angles to the ends, and running the whole length of the cylinder. These are to turn the coffee over, to separate beans and mix them and ensure uniform roasting.

The coffee roaster is not a complicated piece of machinery, and can easily be made locally by almost any blacksmith. . . . .

The size of the roaster may be reduced or increased to meet existing requirements, but the length of the cylinder should bear the proportion to diameter as nearly as possible of 2 or $2\frac{1}{4}$ to 1.

A roaster of the dimensions given will take 40 lbs. at a pinch, or can be worked satisfactorily with only 5 lbs. I would not use a smaller one, however, for a change of from 29 to 30 lbs.

BATAVIA QUININE-AUCTIONS.

According to a report in the *Batavia Nieuwablad*, a meeting of the Commercial Union of Batavia was held in that town on October 9, when the conditions regulating the first quinine-auction to be held at Batavia on February 28, 1900 were finally agreed upon. These conditions are stated to be as follows :—

Art. I.—(1) The sale takes place in lots as specified in the notices, the prices being calculated per kilo. net weight in florins and cents, the cost of packing included.

(2) The lots to be offered will consist of—

(*a*) Parcels of 1 case containing 25 kilos. net, in tins of 1 kilo. net each

(*b*) Parcels of 2 cases, each containing 11·34 kilos. net, in 4 tins of 100 oz. each.

(3) All tins are marked with the registered trade-mark of the Bandong factory.

(4) The Bandong factory provides efficient packing.

(5) The lots are sold in rotation in accordance with the notice.

(6) The net weight of quinine is marked on the outside of the cases, and, in accordance with the notice, must be accepted by the purchaser as correct.

Art. II.—(1) The following quantities will be sold :—

(*a*) About . . . kilos. of sulphate of quinine according to the Pharm. Neerl., edition ii.

(*b*) About . . . kilos. of sulphate of quinine according to the Pharm. Neerl,, edition iii.

(2) The Bandong Quinine-factory supply on application samples of the quinine offered for sale, such samples serving to indicate the kind and quality.

(3) All lots delivered to purchasers will be accompanied by a certificate of inspection concerning the quality, issued and signed

by the Director of the Government quinine-establishments in the Dutch Indies, representing the Dutch Government on the Board or the Bandong Quinine factory.

Art. III.—(1) Payment for the lots purchased has to be made in Batavia, at the offices of the Nederl. Ind. Escompto Maatschappy, within one month from the date of auction.

(2) In case of non-payment the sellers have the right, without notice, to sell by public auction, for account and at the risk of the purchaser, any quinine not yet delivered; and any loss resulting from such re-sale must be made good by the purchaser, but the profit, if any, shall belong to the sellers.

Art. IV.—If, previous to the payment of the undelivered quinine becoming due, such quinine should be lost either by fire or by *force majeure* (the last-named case to be decided by a committee of two, to be appointed by the Bandong Quinine factory and the President of the Batavia Commercial Union), all sale-contracts which have not yet been executed shall be considered as cancelled. If only part of the quinine is lost, or as in the case mentioned in the previous paragraph, only those contracts shall be considered as cancelled under which the quinine could not be delivered.

Art. V.—The quinine can be left without payment of rent in the warehouses of Messrs. Maclaine, Watson & Co. for a period not exceeding two calendar months after the sale.

Art. VI.—All expenses charged by the auction-office for the costs of the sale, including the charge of 1 per cent. for the poor, are payable by the sellers.

Art. VII.—Brokers shall receive from the sellers, after due payment, a commission of ½ per cent. on the value of their purchases.

Art. VIII.—(1) Agents or brokers shall disclose to the sellers or their representative, on the day of the auction, the names of their principals and the quantities purchased for each.

(2) The sellers or their representative have, however, the right, if they should consider it desirable, to demand before adjudication that the name of the principal be disclosed.

It was further agreed by the meeting that it is essential for successfully carrying on the quinine-auctions that they should be held at regular intervals, and that any quinine remaining unsold shall be reserved for future auctions at Batavia; also that the Bandong Works should arrange to offer their whole production at the Batavia auctions, work for the planters at reduced rates, and when the quinine-market is low charge planters only the actual manufacturing-cost. It was also agreed that the auctions should be well advertised in Dutch and English, and that not more than 10,000 to 13,000 oz. should be offered at the first auctions.—*Chemist and Druggist.*

THE PLANTERS' ASSOCIATION OF CEYLON.

The Annual General Meeting of the Planters' Association commenced at Kandy, at 3 o'clock on the 5th instant. There was a very large attendance of planters.

The minutes of the last meeting having been taken as read, the Chairman then, in the course of his opening remarks, referred to the important scientific aid granted to planters by Governor Sir West Ridgeway, who gave them last year an Entomologist and had promised also a Mycologist, both important appointments, which would mark a new scientific era in the Ceylon Planting Industry. The appointment of a Mycologist was a wise and statesmanlike act of the Governor, and he hoped the Governor would complete the scientific staff by appointing an Agricultural Chemist. The Chairman also spoke in high commendation of the prompt, excellent and vigorous measures adopted by the Government to keep plague off the Island. Regarding the paucity of labour the Committee of the Association was fully alive to this matter, and special reports on this subject, drawn up by a Special Sub-Committee, would be submitted later on. It was strongly felt by planters that the Government should not recruit coolies for their own requirements in the same fields as planters drew their coolies from. The Chairman also announced that a Commissioner for the Continent of Europe had been appointed for three years certain. The Chairman concluded by asking the planters to support the Colombo market with the view of helping the development of foreign markets, especially of Russia, in Mr. Ryan's name, and said the matter was very important.

With regard to the Planters' Commemoration building, he hoped that the annual meeting on the 17th February will be held there. The Thirty Committee hoped for a better state of things in America. Mr. Mackenzie was more sanguine. Mr. Mackenzie was rather despondent, owing to the 5 per cent. duty and cheapness of coffee in America, which resulted in a decrease of 26 millions lbs. tea. Mr. Mackenzie had an exceedingly uphill work, and he was glad to say that the Thirty Committee was going to help Mr. Mackenzie further. The next point touched on was the appointment of Mr. Renton as Commissioner in Europe and Paris Exhibition for three years. He hoped, at the end of that time, there would be reported great progress in the tea industry.

Mr. Melville White proposed his resolution in a forcible speech, withdrawing reluctantly the third part of the resolution.

Mr. Ryan seconded.

Mr. Rosling moved an amendment, which was seconded by Mr. Forsyth.

Mr. Charles Gibbon having spoken, the Hon. Giles F. Walker addressed the meeting in favour of the amendment

THE CEYLON TEA TRADE.

At a meeting of the Royal Colonial Institute held on the 9th ultimo at the Whitehall Rooms, Hotel Metropole, London presided over by Sir Cecil Clementi Smith, an address was given by Mr. John Ferguson, of Colombo, on Ceylon.

The Lecturer said that the closing years of the century had witnessed a rapid extension of cultivation of the cocoanut and other palms both by Europeans and natives, and the full establishment of a great planting enterprise, chiefly in the hands of colonists, in tea. In 1825 Sir Edward Barnes distinguished himself by encouraging systematic coffee cultivation by opening a plantation of his own, and in 1837 great impetus was given to the industry by the introduction of the West Indian mode of cultivation by Robert Boyd Tytler. By 1877 the export of coffee rose to 1,000,000 cwts. which in the markets of Europe was worth between 4,000,000*l.* and 5,000,000*l.* sterling. The leaf fungus wrought disaster to the industry, but many planters remained at their posts and carried on the trade with great economy, until the day came that tea, a much hardier plant, was found to grow where coffee failed. The export trade in Ceylon tea began in 1873 with 23 lbs. By 1879 it rose 100,000 lbs.; in 1889 to 34,000,000 lbs.; and 1899 would probably show a total export of 125,000,000 lbs. There were now of all ages about 380,000 acres, including native gardens, cultivated with tea, and were it not for the check given by fixing the value of the rupee at 1s. 4d. (a blessing in disguise to planters, as discouraging over-production) they would ere now have seen 400,000 or more acres covered with the staple product. Many of them hoped that the Indian Currency Commission would have compromised by selecting 1s. 3d. as the value of the rupee, and in the interests of the general development of India and Ceylon this would have been better. But considering how very gradually, though surely, Indian and Ceylon tea was getting into consumption in the United States, Russia, and the rest of the Continent of Europe, it might be just as well that for some time to come they should be content with having attained, practically, their maximum production of tea in Ceylon. When the very commendable efforts of the planters, by means of a self-imposed cess, to advertise their teas in the United States, and, more recently, throughout the Continent of Europe, took fuller effect, there would be room for a greater outturn from Ceylon. A good deal of progress had been made in North America, and there were promising openings, he was glad to learn from a city friend, in several parts of South America, where Ceylon began to take the place of Maté tea. Much was expected from the Paris Exhibition next year, where the Ceylon Court and tea, as well as other products, would be greatly in evidence. Altogether no effort was being spared by the producers and by many merchants to bring their pure, wholesome teas, carefully prepared in factories equipped with the latest and best machinery and other appliances, under the notice of likely consumers in all parts of the world. The direct trade to countries other than the United Kingdom fostered by public sales in Colombo was represented last year by a total of 23½ million pounds against 93 million pounds to London, and the proportion had been well maintained—indeed, improved—during the present year. It went without saying that the tea plant had enemies, and much had lately been heard of fungoid blights which

had for many years damaged tea in Assam. It must never be forgotten, however, that tea was a far hardier plant than coffee, and its crop was one of leaf, not of fruit, with chances extending over nine out of twelve months in the year, in place of only one or two gatherings of coffee berries. Tea could be pruned down, and all affected portions burnt in a very complete way, without much loss of time in cropping. So far as he could judge, therefore, with the attention henceforward to be given to pests, and to judicious liberal cultivation, the tea industry of Ceylon in the large majority of districts and estates was a stable, reliable enterprise for many years to come. Turning to some of the other estate products, there was cacao cultivation, which, began practically some twenty years ago, now covered 23,000 acres in Ceylon, the export rising from 10 cwts in 1878 to 37,000 in 1898, while it promised to exceed 40,000 cwts. in the present year. There was no prospect of this product being overdone in Ceylon, the area of rich sheltered land suited to its cultivation being very limited. They had next cardamoms—a spice for which there was a special demand in the Indian presidency towns as well as in Europe. Some 6,000 acres were planted with cardamoms on Ceylon plantations, the export rising from 16,000 lbs. in 1880 to 531,473 lbs. last year. For poor old coffee there was little or no hope of revival in Ceylon, and from the million hundredweights of the "seventies" the export fell to a little over 13,000 cwts. last year; but in 1899 there appeard to be an increase, though it could only be temporary, for the Liberian variety did not seem to succeed any more than the Arabian. No doubt the day would come when a trade in preserved fruit would spring up between Ceylon (as it has already done between Singapore) and Europe. It was the custom nowadays to despise Oriental fruits as wanting in flavour. Macaulay, writing from Calcutta, said he had seen no fruit on his table he would not readily exchange for a pottle of strawberries in Covent Garden; but those who had enjoyed a really good "rupee" mango in Ceylon or India, or a feast of mangosteens, would scarcely condemn all Eastern fruit. —*The Grocer.*

REMINISCENCES OF THE AMERICAN COFFEE TRADE.

Mr. Walter J. Peck writes:—

I feel some diffidence in complying with the request of the *American Grocer* to furnish an article for the 30th Anniversary Number of that paper. I will, however, endeavor to give the history of the coffee business from an importer's standpoint in as interesting a manner as possible, coupling the names of some famous men whom I have known and been associated with during my twenty-five years' experience in the coffee industry.

It was with Messrs. Wm. Scott & Sons that I became first connected with the trade who, at that time and for years subsequently, held a very unique position in the coffee industry.

They started in 1858, and were, at the time I was with them, representing as agents such well-known importers as G. Amsick & Co., Busk & Jevons, Wright, Brown & Co., Johnson, Perry & Co., E. D. Morgan & Co., and J. L. Phipps & Co., and the meaning of the coffee law with these firms was that no line should be broken. Cargoes were imported, handed over to two or three first-hand brokers by whom sales were made on the Street The difference was as great at that time between first and second-hand brokers as now exists between the seat members of the Stock Exchange and the "Curbstone brokers of Wall Street." In the late seventies coffee was graded by quarters, whilst now 5-100 is the standard grading.

To explain thoroughly the radical change effected, I would say that coffee was then graded on an imaginary standard called fair, and in this connection it is perhaps as well to explain that W M. Scott & Sons were the authority on the grading of coffee; in fact, whenever it became a question of arbitration either of European or Brazilian shipments, "Jim Scott" was called in, and his ruling was law—seldom was his opinion criticised. Frequently, of course, possibly from indigestion or some similar cause, the grading of coffee was not as regular as to-day, but all the same every one in the business submitted to the ruling. How strange must it now appear to those who knew the times of '80 and the present to realize the difference between the process of grading. Now the grading is done and approved by the New York Coffee Exchanges' official types numbered 1 to 9. No man's word is taken to-day, and all questions of grade are left to the licensed graders of the Exchange.

Well do I remember an article being written by Mr. Carruther of the firm of Arbuckle Bros., and published in the Shipping L attempting to depress the coffee market. This was in 1[illegible], and replied, supporting the market, and argued strongly there was necessity for values to be depreciated. Friends told me I gain the day; anyway, a great commotion was created by the publicatio of the two articles, and the result was a firmer attitude of th market.

It is just seventeen years since the first lot of coffee was sold o the New York Coffee Exchange. It was with me that the bon stood and I appreciate the fact to-day. Many million bags hav been dealt in since, but that 250 bags sold on May 6, 1882, t Mackey & Small at 8¼c for May delivery, will ever be remembere

There was a curious circumstance in connection with that sal Mr. Mackey, now of the firm of Mackey & Small, bought th option. Then the classification committee decided that the type should be more uniform in the differences in grades and this dec sion was delivered shortly after the sale.

Mr. Mackey refused to abide by the new types. This necessitate a fight, and the matter was forthwith referred to a committee. M Mackey appeared before the committee, representing Small & Co while I attended in the interest of my firm. The decision was de livered against my opponents, and Mr. Mackey was expelled fro the Coffee Exchange, though shortly afterwards reinstated wit full honors.

Mr. B. G. Arnold was elected the first President of the Coffe Exchange, in which capacity I believe he continued for some years and I am fully qualified to speak of the many virtues of Mr. Arnol as I was brought daily in contact with him. He was, without ex ception, one of the grandest characters it has ever been my pleasur to know.

Two years later I left the firm of Wm. Scott & Sons, and joine my brother under the title of E. H. & W. J. Peck, which remain our trade heading to-day.

Of all the men in the business twenty years ago very few no remain, and I think the following names comprise the whole list John Donohue's Sons, H. W. Banks & Co., Hard & Rand, Arbuckl Brothers, Wells Brothers, and my own firm.

Great excitement was created on February 3, 1883, by the ex traordinary sale on the New York Coffee Exchange of 57,000 bag of coffee We can hardly realize now that so little could make suc a great fuss. A sale of twice that amount would create no sensa tion in these days.

In July, 1886, options were sold at 7.35 cents, and it then looke as if the price was going lower; but when it came to eleven month later, the crops failed, and speculative interest had been employe 22.25 was the figure.

To demonstrate even further the force this speculative move ment had attained over our product, I may say that my firm fiv times ever owned one cargo of coffee. The crucial time came an the culmination of the "bull" campaign demonstrated itself o June 15, 1887, when options dropped to 15 cents, and the marke closed that day with sales of half a million bags.

Why, you say, is it that the prices of the different grades ar so disproportionate? Why is it that there is not a wider range i prices?

This is a most natural query, and will say in answer that No. 7 at the present figures are either too high or No. 3 are far too low but do not forget that the last few crops have been exceptionall good, and of the finer grades, while roasters of the 6, 7 and 8 grade have been demanded by the trade, therefore the only explanation t give is that the better grades are abnormally low, while the lo grades, say standard grade if you will, are preposterously hig because of scarcity.

Let me say a few words on the importation now carried on by th interior buyers In 1882 there were but five wholesale grocers im porting coffee. and their whole importations did not amount t 20,000 bags. I do not think I should be wrong if I said the import ations by the wholesalers to-day amount to fully ten times tha figure.

Is is not a pertinent question to ask why the out-of-town dealer who seldom take more than 500 to 1,000 bags of coffee, go to Braz to buy, thereby incurring the expense of importation, while the could, as a rule, buy at least 5 per cent. cheaper in this city? O course it is feasible and reasonable to suppose it would be im practicable for the leading roasters to depend on this market t

draw their supplies, but the practicability of the country jobber in assuming the risk of importation is a question in the minds of many of the largest importers yet unanswered.

A question, which is now agitating the coffee market, not only of America, but also Europe and Brazil, is, what the Revision Committee, which meets each year in November, will do regarding the difference in grades at their next meeting, but from the composition of that committee I feel fully assured the result of their deliberations will be equitable and just to the trade in general.

The supply during the last three years of over 28,000,000 bags is to my mind the only cause for the existing prices of coffee, and is based entirely on the law of supply and demand, and the future of coffee depends upon the same law. All estimates agree that the present crop is undoubtedly a large one, and, unless some unforeseen circumstances arise, prices will undoubtedly rule at a low level. At the same time possibilities may occur, seriously affecting future values, such as impost of duty, a question long since mooted; the abandonment of plantations which Brazilian advices lately to hand assure us has already begun, and last, and but by no means least, decreased crop estimates—not an impossibility in a tropical country. The existing distress in Central America, which is constantly increasing, may play no unimportant part in making quotations in the near future.

As a last item. I would strongly speak on the question of money value in the coffee trade. Can it be conceived that the money value of the world's supply of coffee represents considerably less than one hundred million dollars, the bulk of which is held in Europe, where indefinite time loans can be negotiated at a very low rate of interest—in fact, within a fraction of the absolute market value? The visible supply of this country of about a million and a quarter bags represents too small an amount of money to be considered as affecting future operations.

Again, a fact worth remembering is that speculators the world over have long been watching this product, and when they have the slightest encouragement and the present "bear" leader changes his tactics, an impetus will be given to higher prices, which may possibly carry figures too high, as was the case in 1887; and in reference to this, it is well to remember that, while supply played its part, speculative demand was solely responsible for the dizzy heights attained that year.

THE COFFEE-STEALING BILL.

The following is the Report of the Select Committee on the Bill to amend the Madras Coffee-stealing Prevention Act, 1878:—

We, the undersigned members of the Select Committee to whom the Bill to amend the Madras Coffee-stealing Prevention Act, 1878, was referred, have considered the Bill, and have now the honour to submit this our Report, together with the Bill as amended by us annexed thereto. With the exception of two the amendments we have made in the Bill are all of them merely verbal. While not prepared to go so far as to abolish whipping altogether as a punishment for offences under the Madras Coffee-stealing Prevention Act in the case of old offenders, we propose to amend the Act so as to prevent whipping being awarded in addition to the punishment of fine. We are of opinion that in the case of the class of persons specially liable to be dealt with under this Act, whipping is in many cases a more suitable and less objectionable penalty than fining and we have no wish to see the punishment of whipping removed from the Act. We, however, consider that whipping should not be added as a punishment where a fine has been awarded, but that it should be in the discretion of the Magistrate to substitute whipping for fine. We propose to amend Section 13 of Act VIII. of 1878 accordingly. We also consider that the power to grant rewards to informers which is given under Section 14 of the Act should not be exercised without due consideration. We therefore propose to add to the Section a provision making it necessary for the Magistrate when ordering the grant of a reward to record his reasons in writing for so doing. The obligation thus to record his reasons will necessitate the consideration by the Magistrate of the special circumstances of each case, and the Appellate Court will then be able to review the order if it sees fit to do so. We recommend that the Bill as amended be passed into law.

ADULTERATION IN THE UNITED KINGDOM.

The Local Government Board Report says:—

Coffee.—Of the 1,879 samples of coffee examined, 10 per cent. were condemned. As usual, many samples were reported to contain large quantities of chicory. In one case in Cheshire a sample was found to contain sugar. The analyst states that "this was probably due to the practice of roasting coffee with a certain proportion of sugar, which will increase the weight of the coffee from 5 to 10 per cent. This admixture is so skilfully done that each berry is coated with sugar, and anyone buying his coffee in the berry would think he was obtaining it pure. Some may say this is an innocent adulteration, but it is at the same time a most profitable one, for the sugar, which is not much more than one penny a pound, is sold at the rate of a shilling or more." Another sample taken in the West Riding of Yorkshire was found to contain 10 per cent. of ingredients other than coffee. Respecting this, the analyst writes:—"These ingredients consisted partly of chicory and partly of a preparation containing starch, the exact nature of which I was unable to identify, but which was probably derived from maize. The composition of this sample is of peculiar interest, seeing that the foreign ingredients are just those which would be present in an article ground from the fictitious coffee berries now manufactured and sold largely in Germany, and which occasionally find their way into this country. This fraudulent product is manufactured with such skill that even a close inspection does not suffice to distinguish it from genuine coffee berries. Hence a perfectly honest retailer may be supplied by the wholesale dealers with an article composed in part of these fictitious beans without having any suspicion that he is being defrauded." Legal proceedings were taken in respect of 121 out of the 187 samples condemned, and 104 penalties were inflicted, amounting in all to 110 *l.* 4s. 8d. Two of the fines were of 4d.

Tea.—The report shows that the Commissioners of Customs during the year had examinations made by their analyst under the thirtieth Section of the Sale of Food and Drugs Act, 1875, of imported teas before they are taken out of bond. The report of Mr. W. Cobden Samuel, tea analyst, is as follows of the 938 samples analysed:—70 samples of green tea faced, 20 samples of green tea unfaced, 46 samples of green tea capers, 595 samples of black tea congou, 160 samples of black tea dust, 47 samples of black tea siftings. Of the total, 854 were, on analysis, considered satisfactory, and the importations represented by them were accordingly delivered on the certificate of the analyst. The remaining 84 samples represented teas of doubtful character, the results of analysis of which were reported to the Board for their decision, with the result that the whole of these, representing 1,603 packages, were restricted to exportation or for manufacture of caffeine. In regard to samples of tea examined by public analysts, it was stated in the Annual Report for 1896-97 that of the 4,289 samples examined in the previous five years only four had been reported against. In 1897 one sample was condemned, but during the past year, out of 486 samples taken, as many as 15 were adulterated, while 8 more were returned as of inferior quality. Many of these were of the variety known as caper tea, and were reported to contain excessive quantities of mineral matter. Respecting this revival of an old and somewhat ingenious method of adulteration, which consists of the addition of stones and sand to tea in order to increase its weight, and the analyst for the county of Derby writes:—"The practice is defended by interested persons on the ground that the mineral matter is unavoidably introduced during the process of the preparation of the tea for the market. This contention, however, cannot be sustained, as genuine tea practically never contains 1 per cent. of mineral matter in the form of sand. Where sand and stones are present in the proportion found in the samples under observation, these foreign substances must have been purposely introduced, and possibly caper tea is chosen as the chief medium for the operations, because the shape of the leaf after its preparation for sale is favourable for the concealment of the stones. The tea certified by me to contain 4 per cent. of sand and stones was sold at the high price of 3s. 8d. per lb., and the adulteration, which was actually in the excess of the amount certified by me was obviously of a fairly remunerative character." Legal proceedings were taken in 5 instances of tea adulteration, and 2 fines were inflicted.

Cocoa.—As usual, more than one-fourth (56 out of 207) of the samples of cocoa were condemned, and in one case a fine of 20 *l.* was inflicted.

AUXILIARY PRODUCTS : COFFEE.

"Producer" writes to *Capital* :—

Now that tea planters in North East India are turning their attention to other products to supplement the profits from their staple, it may be of some service to state the experience of South Indian planters who have always given much attention to these products. The first to be noticed, *viz.*, coffee, is or was till lately the staple of South India plantations, and it is rather curious to find tea planters turning their attention to coffee at the very time coffee planters here are turning their attention to tea. There are, of course, many very successful coffee districts still to be found in Southern India, but Travancore has become mainly a tea district, a good deal of tea is being planted in the Wynaad, and a commencement has been made in Coorg. There is far more risk attending the cultivation of coffee than of tea, but when coffee succeeds, it pays as only products, which cannot be grown, save under exceptional conditions, do pay. This refers, of course, to periods of normal prices. At prices ruling this year, it is doubtful if even the best estates do more than pay their way. But with products like coffee, which are liable to violent fluctuations in price, and take three or four years to come into bearing, a period of low prices is the best time to open. It is said leaf-disease is unknown in Sylhet, and coffee should, therefore, do well there, if other conditions are favourable. It may be doubted, however, if a scourge, which afflicts such widely scattered countries as Java, Ceylon, and South India, where it has extinguished whole districts, will not appear in North India, if coffee is opened on any scale. Should it appear, the best preventive against it assuming formidable dimensions is a light rainfall, well distributed over eight or nine months of the year, and varying from 70 to 140 inches per annum, with an unbroken drought of three to four months every year to kill leaf-disease and ripen the bearing wood. The other great scourge in South India is the borer, which has been known to kill out whole estates. The remedy against this is to grow coffee under shade, and in districts, where borer is very prevalent, all the trees attacked are uprooted and burnt, and the vacancies carefully replanted. The best trees for shade are Jack (*Artocarpus integrifolia*), the numerous species of Indian fig, and Silver Oak (*Grevillea robusta*). Some indigenous trees make good shade. Some are so bad they have to be carefully uprooted, and many planters prefer to destroy all natural shade and plant their own. The shade should not be all of one sort, but is best of different kinds mixed up. Coffee in South India cannot be grown on a large scale to pay, except on virgin land of the best quality. This may be either bamboo, or primeval forest. Some of the best plantations were formed of primeval forest on mountain slopes at an elevation of 3,500 to 5,000 feet, the soil of which consisted of rich dark mould mixed with large and small rocks. Others were made out of bamboo forest, at an elevation of 3,000 to 3,500 feet, on the plateau some distance inside the Western Ghâts, the soil of which was a stiff loam free from stones. It is in the latter, borer is most dreaded, and coffee cannot be grown, except under a continuous, but light, cover of shade. All the best estates in both kinds of land are steadily manured, partly to counteract leaf-disease, and partly because no land, however rich originally, will continue to crop well for any length of time without manure. The last and, perhaps, the most important requisite for success in coffee-planting is that the annual drought alluded to above shall be followed by regular blossoming showers. These depend entirely on local conditions, and are secured in South India by the situation of the plantations on the inner slopes of the Western Ghâts, or on the plateau between the heated centre of the peninsula and the mountain range near the sea. The clouds form up about noon some distance from the inland slopes of the mountains, and advancing towards them in the face of the sea breeze, drop their showers on the mountains and on the plateau lying at their feet. The neighbourhood of a prominent mountain peak often secures regular showers for the plantations around it, while plantations near less prominent portions of the range often have the showers drawn away from them, and have had to be abandoned on account of the frequent failure of crop for want of timely rain. The writer has seen a fine blossom spike knocked off unopened by too late rain and lying on the ground like so much raw rice, because the bud had perished from drought before the rain came.

The cost of opening coffee may be reckoned as rather less than that of tea, being about Rs.300 an acre, though it has often been done for Rs.200 an acre. All depends on the style of opening and the class of buildings and machinery. The latter are not nearly as expensive as for tea, and, at first, may be of a very inexpensive nature. The cost of cultivation varies from Rs.100 to Rs.150 an acre a year, though some planters spend as much as Rs.200 an acre, chiefly in heavy manuring, with of course proportionately heavy crops. Good estates give an average of 5 to 7 cwts. per acre, though occasional crops of 10 or more cwts. per acre are not uncommon. On the other hand, owing to the ravages of leaf-disease many estates do not average over 1½ to 2 cwts., and these are going into tea, or are being supplemented by cinchona and pepper. Liberian coffee has been extensively tried in South India, but has failed owing to the prolonged droughts. It requires rain in every month of the year, and does well in such a climate as the Straits at almost sea level. A hybrid between Arabian and Liberian has, however, been established, which promises to resist both leaf disease and drought. Great things are hoped of this on account of its marvelously vigorous growth and heavy cropping powers. The experiment is yet in its infancy, but hybrid seeds are being offered for sale early next year for the first time.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a Meeting of the Committee of the Shevaroy Planters' Association held in the Victoria Rooms, Yercaud, at 1 p.m., on Monday, the 4th December 1899. PRESENT:—Messrs. W. J. Lechler, C. G. Lechler, Thurston Short, T. B. Nicholson, Rev. M. Anderson, Messrs. C. Rahm, R. Gompertz, (*Honorary Secretary*).

1. *Read* circular from Secretary, U. P. A. S. I., saying that Mr. G. L. Acworth had suggested that a subscription list should be opened for the relief of sufferers in the Transvaal War.

Resolved that Honorary Secretary be requested to reply that as some of the planters had already subscribed to the fund being collected by Messrs. Arbuthnot & Co., and others to that being locally raised in the station of Yercaud, we are unable to support Mr. Acworth's suggestion.

2. *Read* letter from Mr. A. G. Nicholson proposing that Government be requested to remit the kist for the next fusli on account of the damage done by the long drought and also of the unremunerative prices obtained for the past and present crops.

Resolved that, in view of the difficulties with which Government has to contend on account of plague and famine, no remission should be asked for at present.

3. Read circular from Secretary, U. P. A. S. I., giving five names of gentlemen suggested as successors to Mr. Frank Mangles, and requesting that we should nominate one of them as the representative of the U. P. A. S. I. on the London Chamber of Commerce.

Resolved that, in the opinion of this Association, any one of the five gentlemen named would represent us admirably, but that we should prefer Mr. P. Macfadyen.

Read and *Recorded* the following letters:—

Circulars from the Secretary, U. P. A. S. I.

85/U. W. Modifications in the Draft Labor Bill suggested by the L. P. P. A.

96/U. W. Forwarding letter from Mr. Mangles to the effect that it is of no use moving further at present to stop adulteration of coffee.

86/U. W. Suggesting that the agitation about the adulteration of coffee should be postponed till a more favourable time.

87/U. W. Enclosing letter from Mr. Romilly saying we ought to support the Indian Tea Association in their action with regard to abolition of import duties (see 93/U. W.)

88/U. W. Asking the meaning of the words "in proportion" in resolution at last meeting regarding our subscription to expenses of Paris Exhibition.

89/U. W. Insisting on the necessity of accuracy in statistics furnished to the Association.

90/U. W. Necessity of liberal subscriptions to expenses of "Paris Exhibition."

92/U. W. Giving a number of questions put by Mr. David-son regarding the Paris Exhibition and Secretaries' answers to them.

93/U. W. Enclosing letter from Mr. Romilly saying that the nation having become involved in war since he wrote advocating

the abolition of tea duties, he thinks it would be unpatriotic to press for a reduction of taxation at the present time.

95/U. W. Sending sample of the common seal adopted by the U. P. A. S. I.

38/C. Correspondence about Mr. Pope, Assistant Surgeon, which stood over from last meeting.

The following papers were laid on the table :—

Planting Opinion (3 copies), dated November 11th, 18th and 25th.

One copy of the Journal of the Royal Agricultural Society of England.

Proceedings of the Nelliampathy Planters' Association.

Proceedings of the Coorg Planters' Association.

YERCAUD, *7th December*, 1899. (Signed) R. GOMPERTZ, *Honorary Secretary, S. P. A.*

THE BIG PRIZE TURKEY.

"A Merry Christmas, Bob," said Scrooge, with an earnestness that could not be mistaken, as he clapped him on the back. "A merrier Christmas, my good fellow, than I have given you for many a year. I'll raise your salary, and we will discuss your affairs this afternoon over a bowl of smoking bishop. Make up the fires and buy another coal scuttle, Bob Cratchit."

And as to the big prize turkey which the regenerated Scrooge sent to Camden Town, do we not all know what sort of bird it was? That turkey never could have stood upon its legs, Mr. Dickens says. They must have snapped short off like sticks of sealing wax. How they managed to cook and eat that phenomenon the author doesn't say, as it was twice the size of Tiny Tim. Yet they did it somehow, and it was a mercy if the family (previously half starved) didn't all fall ill of the unwonted gorging of that wonderful Christmas day.

Even assuming (as we easily may) that the transmutation of an old skinflint like Scrooge into a high priest of charity was quite beyond the common run of modern miracles, and that dinners from such sources are as rare as they are welcome, it still remains true that human nature is apt to be at its best at Christmas, especially in England, where, of all countries in Christendom, most is made of that gentle and kindly holiday.

Yet, sad to tell, the very jollity and generosity of Christmas leads to regretable excesses. People eat and drink too much, and suffer accordingly. The roast and the boiled, the mince pies, the plum puddings, the tremendous flushings of wine, beer, and other beverages, these things overload the stomach and give the digestion more work than it can do, and punishment follows. For Nature has no favourites; she treats those who violate her laws on the 25th December exactly as though they had committed the offence on the first Monday in August.

And as to the chronic dyspeptics, of whom there are enough in this old island to cram all the parks in London, *they* catch it fearfully about Christmastime. For, in spite of all warnings, they will go in for heavy meals and take the chances. Often the penalty is an acute attack which may threaten life, and nearly always weeks of pain and digestive disorders, whereof there are as many kinds as the body has organs and functions.

To them Christmas may be "merry" for an hour or two; then their merriment turns into misery, as October fogs and rains succeed a hot summer.

Now the writer is far from advising a free indulgence in the gustatory and bibulous festivities of the country's most popular holiday, but there is no use protesting against the fixed resolution of the people to enjoy themselves on that occasion. The customs and traditions of centuries are behind it, and you might as well whistle in the teeth of a north-east gale.

As a prophylactic and a cure for the evils alluded to, I can only recommend the universal use of Mother Seigel's Syrup, known to all as the best stimulant and digestant in the world.

In a letter dated January 10, 1899, a gentleman of Birmingham, who loves the pleasures of the table, and has money enough to buy whatever he wants, writes thus :—It is only fair that I should thank you, as I do with all my heart, for the good done me by Mother Seigel's Syrup For years I have been vexed with indigestion, and always had a tormenting spell of it after any public banquet or uncommon intake of rich food. Still, I was seldom able to resist temptation, although I understood perfectly well what yielding to it was sure to cost me. I have sought a preventive or a cure in vain at the hands of the best physicians, all of whom assured me that there was but one way, namely, to live on a low diet, and let luxuries alone.

"But this did not suit me, and I broke through the regulations frequently, with the inevitable results. However, when I began to use Mother Seigel's Syrup I had (almost) a license to do as I pleased. After an inviting but most risky dinner last Christmas I took a double dose of 'Mother Seigel,' and scarcely suffered at all. I told my experience, and a dozen friends adopted this amazing remedy right off. I am convinced that, with a little caution, and a dose of Mother Seigel's Syrup now and then, *one may bid defiance to dyspepsia* and the abominable ailments it sets up. Thanking you a thousand times, I am, yours truly, JOHN MACFARLANE."

With these facts we wish a merry (and a *healthy*) Christmas to the British people.

MARKET REPORT.

[*Per Mail Advices of 17th November* 1899.]

COFFEE.

The London Commercial Record says :—Supplies at auction during the week have not been excessive, but demand has shewn some irregularity. The market opened with a strong tone, and prices generally favored sellers, but subsequently there was less disposition to operate and the best prices were not always maintained, except for really colory samples, which are very firm. In consequence of varying rumours from the Brazils the markets for "futures" has been subject to sharp fluctuations, advancing 1s early in the week, but losing this and an additional 1s later on, closing at 6d decline, *viz.*:—

London ...	Santos ...	May	delivery	... 32s. 0d.
New York	No. 7 Rio...	„	„	... 5·65 cents.
Hamburg...	Santos ...	„	„	... 31¾ pf.
Havre ...	Santos ...	„	„	... 37¾ francs.
Holland ...	Good ordinary Java ...	...		... 31 cents.

The Dutch Trading Company announce their next public sale for Tuesday 21st instant at Amsterdam when 24,770 bags will be offered; good ordinary Java is valued at 31 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons	18,301	17,253	43,465	42,072
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons	14,575	12,321	25,000	22,189

The preceding figures exhibit— Tons.

In the Imports an increase this year of ...	... 1,393
Home Consumption an increase of ...	... 2,254
Export an increase of...	... 2,811
Stock an increase of	... 1,048

Auctions this week have gone off as under:—

CEYLON—*Plantation.*—15 casks 3 barrels 8 bags sold, smalls 61s, middling 80s, bold 90s to 91s, pea-berry 80s. 255 bags *Native* brought in.

EAST INDIA.—1,158 bags partly sold as follows: *Coorg*, smalls 31s to 40s, low middling to middling 41s 6d to 53s, common to fair bold 59s 6d to 66s, good colory 73s 6d to 75s 6d, pea-berry 58s to 75s 6d. *Wynaad*, low middling 38s to 42s.

NYASALAND.—239 bags half sold—smalls 38s to 42s 6d, low middling dull greenish 42s 6d, bold colory 63s, pea-berry 47s 6d to 50s.

MOCHA.—70 half-bales withdrawn.

JAVA.—80 bags imitation and 131 bags LIBERIAN were bought in.

JAMAICA.—59 barrels 13 bags offered, but only 12 barrels sold—ordinary greenish 29s 6d, middling brownish 47s, pea-berry 52s 6d.

COSTA RICA.—Of 640 bags offered only 60 bags sold—smalls 30s, low middling 49s 6d, good middling 67s 6d to 68s, ordinary bold 57s, fine bold blue 95s, pea-berry 50s.

GUATEMALA.—Of 752 bags catalogued 540 bags sold—low middling 42s 6d to 48s 6d, middling to good middling blue 51s 6d to 67s, fair colory bold 70s, pea-berry 50s to 57s.

SALVADOR.—Of 685 bags offered 515 bags sold—smalls 36s, low middling polished green 40s, middling 48s, common bold 56s to 58s, pea-berry 55s.

Nicaragua.—52 bags half sold—good ordinary greenish 35s 6d.

Colombian.—4,389 bags mostly sold—small 28s to 41s 6d, low middling to middling colory 42s to 53s, good to fine middling 53s 6d to 65s 6d bold 68s to 77s, good to fine 78s to 85s, extra bold 90s 6d, pea-berry 50s to 86s.

Venezuela.—22 bags mostly sold—low middling dull gray 46s 6d.

Peruvian.—154 bags sold, smalls 39s to 40s, middling brownish 49s 6d to 51s 6d, pea-berry 48s to 55s.

Brazil.—Of 2,229 bags offered 460 bags sold—Dumont Santos, good bright greenish foxy 32s, pea-berry 30s to 40s quay terms; washed ditto, smalls 31s 6d, medium 33s 6d, pea-berry 47s 6d to 53s landed terms

Auction supplies to-day comprised:—220 bags East India, 631 bags Nyasaland, 18 bags Bornea Liberian, 21 packages Mocha, 133 bags New Granada, 34 bags Vera Paz, 1,234 bags Columbian, 275 bags Salvador, 153 bags Guatemala, and 250 bags Santos. The sales went off at irregular prices, but all good qualities sold well at full rates. Nyasaland cheaper.

Receipts in Rio and Santos.

Since July 1	1899-1900. Bags.	1898-99. Bags.	1897-98. Bags.	1896-97. Bags.
Rio	1,741,000	1,483,000	2,183,000	1,717,000

Total ...	5,609,000	4,601,000	5,903,000	4,592,000
Crop .	—	8,772,000	10,461,000	8,680,000

Rio Exchange —d, previous day $7\frac{1}{16}$d.

Havre, Nov. 16.—Santos good average December opened steady at 36¼f. and closed steady at 36¾f., March opened at 37f. and closed at 37¼f.

Hamburg, Nov. 16.—Good average Santos December opened steady at 30¼pf. and closed steady at 30½pf., March opened at 31pf. and closed at 31¼pf.

New York, Nov. 8.—Closing prices of No. 7 Rio were as follow:—

	Nov.	Dec.	Jan.	Feb.	Mar.
Nov. 15 ...	5·30	5·30	5·35	5·40	5·50
Nov. 14 ...	5·25	5·30	5·30	5·40	5·45

IN AMERICA.

The deliveries continue large—not quite up to the previous week, but far ahead of corresponding week last year. The market is fairly strong for all grades and sorts of coffee. There was a slight reaction in Rios, which fell to a basis of 6 1-16c for No. 7, but at the close the feeling is better; No. 3 held at 7¼c, with sales of No. 3 Santos at 7c, c. and f Padang interior firm at 24@25½c; fancy mats, 28@34c, and possibly higher for very fine, which is scarce. Good Cucuta strong at 8½c, or better. Mocha, 17@19¼c, and higher for fancy. Washed Central American and Mexican of the better grades, 10@13c.

MR. ARNOLD SCHRAMM ON MILD COFFEE.

"Since my last the coffee market has continued firm, with prices hardening for desirable goods. From Venezuela (whence come all the Maracaibo and Laguayra coffees) we get news of a new uprising against DeCastro, the revolutionist, who had just driven the President (Andrade) out of the country, and it looks as though there would be considerable trouble there before the political atmosphere can be cleared, and during the time that this will take, it is reasonable to expect very light shipments of coffee from there.

"In Colombia, also, there is a general insurrection against the Government, and the river boats have been seized for war purposes, which will result in the total stoppage of shipments of Savanilla coffee. Colombia produces the various kinds of coffee known as Savanilla, and which comprise Bogota, Bucaramanga, Ocana, Cauca, etc.—the coffees known to the trade.

"There are no changes in quotations since last week, but I should judge that if the receipts continue very light (which must be) from Venezuela and Colombia, we will probably see a further advance in the grades of coffee coming from those countries."

TEA.

China.—The steady tone for Congous of the better grades continues, and even the commoner kinds shew a rather improved position. Auctions during the week have offered 5,245 packages the greater part selling as follows:—Scented Caper 6¼d to 7½d, Scented Orange Pekoe 5¾d to 8¼d, Paklin 6¾d, Souchong 6½d. Green.—Gunpowder 7½d to 1s 0½d, fine 1s 6¼d, Imperial 4½d to 7¾d; Young Hyson 4¼d to 8¼d; Hyson 4d to 4½d. Sou Mee 7¼d to 1s 3d. Moon Mee 8¾d to 1s 2d per lb.

Indian.—About the same quantity was brought forward, *viz.* 51,000 packages, compared with 50,200 packages in the preceding week, and 46,800 packages a year ago.

The market opened with a steady tone, previous rates being fully maintained for nearly all kinds; later on, however, there was less disposition to purchase unless at a slight concession. Calcutta bought Pekoes were more plentiful at 6½d per lb., while common to fair Broken Pekoes, except when possessing strength, sold easier. Good medium, both leafy and broken, with attractive cup rules firm, but others were often neglected. Fine and finest which were in rather limited supply elicited considerable competition, particularly some of the Darjeelings, the following results being noticeable:—Assam:—Pabbojan Co., 120 packages, 1s 3¼d; Doomur Dullong Estate, Am.Co., 322 packages, and Khoontai Estate, Am.Co., 167 packages, 1s 0½d per lb. Darjeeling:—Phuguri Estate, A.T.E.Co., 72 packages, 1s 10d; Nagri Estate, A.T.E.Co., 157 packages, 1s 4d; Rungmook Estate, 144 packages, 1s 1¾d per lb.

For 39,500 packages on Estate account 8¾d per lb. was realised, contrasted with 8⅝d per lb. for 32,800 packages and 8⅝d per lb. for 32,200 packages in the two former seasons.

Entries for export to the United Kingdom for the first half of the month were 13,000,000 lbs. versus 9,810,000 lbs. in 1898, making the totals from 1st April 109,592,000 lbs. and 100,847,000 lbs. respectively.

Ceylon.—Auctions were lighter, embracing 23,200 packages against 27,800 packages on the 7th instant, and 18,300 packages for this period last year.

On the whole the selection was hardly so desirable, but taking this into account prior quotations were about upheld. Pekoe Souchongs and Pekoes for price were again in strong request. Medium to fine especially when assisted by orders from abroad, also passed well. The good value recently obtainable in Broken Pekoes from 8d to 1s per lb. has somewhat stimulated the demand, therefore bidding for them was more brisk. Consequent on the scarcity of "tippy" and choice flavoured parcels, much eagerness was displayed to secure the few available, among the best Broken Orange Pekoe being:—Dimbula 1s 7¾d, Mount Vernon 1s 7¼d, Talawakelle 1s 5¾d, Warleigh 1s 5¼d, Cranley and Lindoola 1s 3¼d per lb.

The average is the same as on the 9th instant, *i.e.*, 8¼d per lb. On the 16th November, 1898, it stood at 8½d per lb.

Java.—Only 154 packages of direct import were submitted, which commanded attention without any material change. No further catalogues have been at present issued.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

	Lbs.
From 1st to 14th Nov., 1899	9,781,07
Do. do. 1898	9,036,68

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered Pkgs.
India	43,337	7,763	51,100
Ceylon ...	21,207	2,023	23,230
Java	121	33	154
Total ...	64,665	9,819	74,484

Also 119 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 17th, 1899, says:—

Quantity brought to Auction in London from 1st June to Date.

	Indian. Pkgs.	Ceylon. Pkgs.	Java Pkgs.
1899-1900	739,174	580,946	28,33
1898-1899	632,912	568,882	21,43

51,209 *pkgs.* Indian
23,417 „ Ceylon
154 „ Java
} Total 74,780 packages were offered in public auction this week.

The new regulations concerning Taring, which it was hoped would come into force on the 2nd October, are to commence on the 1st December, *viz.*:—

The empty package to be weighed to the ½-lb.

(*a*) Should it weigh the exact even pound it is to be entered as such.

(*b*) If it weighs the even ½-lb. or over it is to be entered as the next pound above.

(*c*) If it weighs below the ½-lb. it is to be entered as the 1-lb. below.

The Custom House authorities have informed the Indian and Ceylon Tea Associations that they are about to issue an order to this effect. With a view to obtaining a correct average, more packages than at present are to be tared, the option of taking separate tares for Teas bulked in London being left to the trade, as at present. The method of weighing gross now in force will still be continued.

INDIAN.—Sales were rather heavy this week totalling 51,209 packages. No material change took place in rates current last week, the demand for all grades being very firm, and price Teas steady at the late advance. The official wire gives exports to U.K. for first half of November as 13,000,000 lbs., against 9,810,000 lbs. same period 1898, making the total from 1st April to date 109,592,000 lbs., against 100,847,000 lbs. to same date last year. The following averages are worthy of note:—"Amal. T. E Co. Nagri," 1/3¾; "Pabbojan T. Co." 1/3; "Con. T. & L. Bloomfield" and "Rungmook," 1/1⅜.

Week's av. of Tea sold on Garden Account 1899, 39,742 pkgs., av. 8·81d. 1898, 32,988 pkgs., av. 8·23d.

Total Tea sold on Garden Account 1st June to date 1899, 541,594 pkgs., av. 8·60d 1898, 516,042 pkgs., av. 8·60d.

CEYLON.—Only 23,417 packages were brought forward, against 28,804 last week. The auction passed with strong general competition, all descriptions being freely bid for at firm rates. Private telegraphic advice gives exports to U.K. for first half of November as 3,500,000 lbs., against 3,500,000 lbs. 1898, and estimates the total for the month as 7,000,000 lbs., against 6,500,000 lbs. last November. The following averages may be mentioned:—"S. T Co. St. Leonards," 1/-; "Nuwara Eliya T. Co. Park," and "Madulseema Co. M." 11¾d. Avge. for week 8·15d., against 8·38d. in 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 958,236 pkgs., av. 7·98d. 1898, 994,850 pkgs., av. 7·74d.

JAVA.—Only 154 packages were brought to auction, and so far no catalogues are issued.

Bank Rate 5 per cent. Exchange on London three months sight:—Calcutta 1/4⅜. Colombo 1/4⅜.

IN AMERICA.

The imports of tea in September were 14,313,573 lbs. valued at $1,769,341, against 5,876,420 lbs. valued at $808,734, in September, 1898. Total imports for nine months ending September 30 were 60,116,703 lbs. valued at $7,566,957, against 47,299,008 lbs. valued at $7,844,749, for corresponding period in 1898 and 68,973,105 lbs. valued at $9,198,356 in 1897. This is a good showing, and indicates that conditions in the tea trade are again normal; that old stocks have been wiped out and that the volume of imports from now on will be more in accord with former years than was the case in 1898.

Of the total imports 29,448,946 lbs. came from China, 25,661,541 lbs. from Japan, 1,744,003 lbs. from the United Kingdom, 1,384,552 lbs. from British North America, 1,768,438 lbs. from East Indies, 104,044 lbs. from other places in Asia and Oceanica, and 5,179 lbs. from all other countries.

At the last auction sale on October 25 the Montgomery Auction and Commission Company sold, net cash, in bond, unless otherwise stated, 9,302 packages tea, *viz.*, 554 Moyunes, 3,951 Pingsueys, 126 pan-fired and 233 basket fired and sun-dried Japans, 115 Dust, 695 Congous, 113 Indias, 182 Foochows and 3,333 Formosas.

COCOA.

No auctions have been held this week, but privately a very fair trade has passed at full rates, transactions including—800 bags Trinidad at 75s to 77s for good to fine and 73s to 73s 6d for middling, 100 bags Grenada at 65s to 67s, 200 bags African at 64s 6d for fine, some Puerto Cabello at 105s to 145s, 600 bags Guayaquil at 66s for greyish Caraquez and 68s to 72s 6d for ordinary to fine Arriba, and 600 bags Ceylon at 58s to 62s for fair to good Native and 74s to 77s per cwt. for good red.

PEPPER.

BLACK.—There has been a continued good demand for Black Singapore on the spot at 5¾d cash less interest; of near at hand parcels sales have been made at 5 3/16d, October shipment at 5⅞d and February-April at 6 3/32d; about 150 tons sold.

At public sale on Wednesday all the offerings passed the hammer unsold, *viz.*, 293 bags Singapore, 43 bags Estate Penang, and 125 bags Tellicherry.

The shipments of Black Pepper for the first half of November compare as follows:—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	50	120	80	80
„ Penang	70		*nil*	
Continent		70		20
United States		*nil*		60
Total ...		190		160

WHITE is inanimate with business of small importance. A small quantity of Singapore near at hand done at 8⅞d.

At auction on the 15th instant, 28 bags 15 cases Singapore, 11 bags Gapis, and 159 bags Penang were all bought in.

The shipments of White Pepper for the first half of November compare as follows—

	1899. Tons.		1898. Tons.	
U. K.—Singapore	310	350	110	240
„ Penang	40		130	
Continent		50		50
Total ...		400		290

GINGER.

COCHIN.—The volume of business has swollen considerably this week, demand having been brisk, and holders have given several turns to the screw, compelling buyers to pay materially higher prices in many instances. The special feature is the rapid rise in cut descriptions—which some few weeks ago we pointed out was almost sure to result—and at the enhanced rates the position seems even better than before. Private sales, which have been fairly heavy, include the following:—Medium and bold Native cut 64s to 66s, small and medium ditto 42s, small cut 35s to 37s 6d, good to fine Calicut rough Sorts 29s to 32s, fair to good medium and small washed rough Cochin 27s 6d to 30s, and mouldy and wormy ditto 25s to 26s Catalogues on Wednesday comprised 186 cases 799 bags, of which 54 cases 218 bags sold, cut descriptions bringing further advances, whilst firmness prevailed for other kinds; bold, some medium, roughly cut and scraped, limed, realised 80s, medium ditto 65s, medium, some small, ditto 61s to 61s 6d, medium part boldish very rough and heavily limed 46s 6d, small and medium 45s, and medium and small washed rough, wormy, 25s 6d to 26s per cwt.

CINCHONA.

At the auctions on Tuesday ten brokers brought forward supplies amounting to 4,105 packages—a larger quantity than has been seen for some months past. At the opening of the auctions there was a brisk demand, which, however, became quieter towards the finish. The bulk was disposed of at a general advance of about 10 per cent. on the last auction in Amsterdam, the unit averaging 1¼d. to 1⅜d, against 1d. at the last London auctions and 1¼d. at the Dutch sales.

The following table shows the quantity offered and sold:—

	Packages offered.		
East Indian cinchona ...	2,742, of which 1,931 were sold.		
South American cinchona ...	541	„	329 „
Ceylon cinchona	410	„	352 „
Java cinchona	412	„	321 „
	4,105		2,933

The following are the approximate quantities purchased by the principal buyers:—

	Lbs.
The Brunswick factory	199,374
The Mannheim and Amsterdam factories ...	135,694
The American factories	125,391
Messrs. Howards & Sons	62,246
The Frankfort-on-Maine and Stuttgart factories ...	38,380
The Imperial quinine-factory	7,855
Sundry druggists	75,281
Total amount of bark sold ...	644,221
Bought in or withdrawn ...	266,506
Total amount of bark offered ...	910,727

SOUTH AMERICAN.—A bid of 1½d. per lb. was refused for 64 bales of Cuprea imported in 1884. Twenty bales of Cartagena and 8 bales of New Granadian were bought in. Bolivian cultivated Calisaya sold at 8⅞d. for good rich quill, and from 7¼d. to 7⅞d. for fair,

down to 6¼d. per lb.; fine flat, 9⅜d. per lb. for sound. Of 76 packages soft Colombian, 48 sold at 1¾d. to 2d.

Java.—Ledgeriana, original stem chips and shavings 3¾d. to 4⅛d Red original stem 4⅛d. to 5¾d.; root, 4⅛d. to 4½d. per lb.

Ceylon.—Officinalis, natural stem chips, fair to good 3¾d. to 5½d. Hybrid, chips, 4d. to 4⅛d. per lb. Succirubra, ordinary to fair original stem chips, 2⅝d. to 4⅞d. per lb.; shavings, 3¼d.; branch, 2¼d. to 2¾d.; root 3⅛d. to 3¾d.; fair red quill, 4⅛d. per lb.

East Indian.—Ledgeriana, original stem chips, 3⅜d. to 6⅜d. branch, 3¼d.; and root, 3⅞d. per lb. Hybrid, original chips, 2⅜d; renewed ditto, 2½d. to 3½d. per lb. Officinalis, stem, chips, and shavings, 3d. to 6⅞d.; goed root, 3⅞d. to 4½d. per lb.; renewed chips and shavings, 2½d. to 8⅜d.; broken quills and chips, 2d. to 7⅝d.; stem chips, 5⅛d. to 6d. per lb.

The exports from Ceylon from January 1 to October 24 have been—

	1899.	1898.	1897.	1896.
Lbs.	534,640	764,408	611,926	1,231,359

QUININE.

Quinine has been in more demand this week, and up to Tuesda prices in second hands were unchanged at 1s. 1¾d. per oz. fo December, and 1s. 2d. for March delivery. After the bark-sale however, the market was firmer, business being done at 1s. 1⅞d. t 1s. 2d. for December, and 1s. 2⅜d. for March. On the spot 1s 2¼d was quoted on Wednesday. with buyers at 1s 2d. per oz., bu to-day 1s. 2¼d. was reported paid for December, and 1s. 2½d. fo March. Makers' quotations are unchanged so far.

The shipments from Java during August were 404 cases, all o which were shipped to the United Kingdom. From July 1 t August 31, 132 cases have been shipped, against 346 cases for th same period of 1898. By the SS. *Cyclops* 33 cases Java quinin (Ed. II.) arrived last week in Amsterdam containing 396 kilo (13,860 oz.), and 17 cases Java quinine (Ed. III.) 204 kilos. (7,14 oz.) from the Bandong quinine-factory.

(Average for all India 8·81d.), November 17th.

Coorg.

Polli Betta, 13*th December*.—*Weather*.—Bright, cool. Some east wind. A drop in latter yesterday, and some clouds came up. *Plant-diseases*.—"Leaf" has not quite passed off. Pruning, which is now in progress, will clear off what remains of it perhaps. Coolies being paid off this month. Price of grains still continue high. *Ragi*.—12 seers the rupee. *Gram* is cheaper. *General Health*.—Good.

THE IMPORTATION OF SEEDS.

At a recent meeting of the Chamber of Commerce and Agriculture, Blantyre, B. C. A., one of the members referred to the importation of Albizzia seed from India, and suggested that more drastic measures should be taken to preclude the possibility of infected seed coming into the country. This matter was left in the hands of the Committee to be dealt with. In a recent number of the *Queensland Agricultural Journal* appears a paper on "Coffee-leaf Disease and Seed Importation," which shows that Queenslanders, as well as "British Central Africans" are being asked to consider the perils attaching to the importation of seeds. The Queensland article is apparently based on the now famous packet of seeds that was ordered from "Mr. Chisholm, India," by a Queensland coffee-planter. The journal gives us a brief history of the fate of this packet. It was seized and confiscated by the Post Office authorities in Brisbane. The consignee protested against the seizure on the ground that the seeds in question came under the head of "grain,"

against the importation of which there is no prohibition. Apparently, the result of the appeal is not yet known, but at least no intimation is forthcoming that the seed has been admitted into the colony to which it was despatched.

We are quite at one with our Australian contemporary in the belief that the matter is one that deserves the serious attention "not only of planters and agriculturists but of the whole community as a body"; but beyond this our opinion branches off from that of the *Q. A. J.* Our contemporary's remarks may be briefly summarised as follows:—Whilst many years ago coffee-planting was the principal industry in Ceylon, at the present day coffee in that island is a thing of the past, owing to the ravages of the parasitic fungus *(Hemileia vastatrix)* known as the coffee-leaf disease. Of late years spasmodic attempts have been made to revive the industry, but without avail. The existence of quantities of wild coffee in the jungle operates against the planters. The disease remaining with the wild plants cannot be eradicated, and what was once a source of great wealth to the planters and consequent prosperity to Ceylon has had to be finally abandoned, and cinchona, cacao, and tea have successively taken the place of coffee. This, it is argued, shows how very necessary it was to make stringent laws against the possible introduction of the disease into the young plantations in Queensland, and to carry out those rules regardless of sentiment. Mr. H. TRYON, Entomologist to the Queensland Department of Agriculture, reported that the disease might be imported in various ways, and particularly by the vehicle of seeds. He stated that, since its appearance in Ceylon, *Hemileia* has been reported on coffee in Continental India, Mauritius, Samoa, Fiji, Java, Sumatra, New Guinea, Natal, German East Africa, and Guatemala, though not at the present day, it is thought, existent in all of these countries. In the case of its occurrence in Fiji, Sir WILLIAM MACGREGOR, who had exceptional opportunities for investigating the subject at the time, pronounced the opinion that it had been brought from Ceylon, its spores having accidentally become attached to the charcoal in which seeds had been packed. So in the case of German East Africa, its origin was traced to seeds imported from India. As for Queensland, it is said that, in the case of one fungus disease occurring within a circumscribed area in the Cairns district, there are grounds for concluding not only that it is identical with a malady of the coffee-plant occurring in India, but also that it has been imported on seeds from that country.

Under these circumstances, it is not surprising that there should be a disposition on the part of scientists in Queensland to follow the example of Jamaica and some other places, and exclude coffee-seed shipped from countries where leaf-disease is known to prevail or to have prevailed. The regulations under "The Diseases in Plants Act of 1896" absolutely prohibit the importations of all trees, plants, fruits, or seeds from India, Ceylon, the East Indies, East African Colonies, and from all other countries in which the coffee-leaf disease is known to exist, although the Minister for Agriculture may, at his discretion, import any such plants or seeds which shall, when so imported, be suitably disinfected and detained and grown in close quarantine for not less than twelve calendar months. This is a very stringent limit on the discretionary powers afforded, and yet we should like to have seen the *Queensland Agricultural Journal* lay more stress upon the expediency of putting these powers to some practical use. What it says is, that importations of the nature and sources contemplated should alone be made under special safeguards. To this end it is recommended that the assistance of the Director of the Royal Gardens, Kew, be invoked. "This great establishment has, for some years past, paid continuous attention to the subject of leaf-disease and is fully alive to the importance of developing the tropical industries of the dependencies of the Crown, in which work it has in the past laboured so successfully. Moreover, owing to its important and numerous agencies throughout the world, it possesses exceptional facilities for meeting any demand that might be made upon its resources." We cannot but think that there is too much of the negative element about all this. Men, like plants, are liable to disease, and special precautions against importation from infected areas are taken even in regard to human beings. Think, however, what would happen if, because plague prevailed in parts of India, any man wishing to travel from India to Queensland had to go first to some substitute for Kew, there to be inspected, disinfected, and, perhaps, quarantined for a long time! It seems to us that with plants as with men, only *reasonable* precautions should be taken. The Queensland Act referred to becomes reasonable only when the discretionary powers it confers are exercised with a discretion untainted by bigotry or cowardice. For our own part, we hold that careful importations of seed, under reasonable restrictions, should tend more towards the strengthening of plants, and the building up of disease-resisting species than towards the dissemination of particular diseases. Science is instructive on the subject of the improvement of strains, as well as in regard to the propagation of infectious diseases.

TOBACCO.

II.

We propose to give in our next issue some account of native methods of cultivation in this country, but before doing this we extract from the *Queensland Agricultural Journal* a paper by Mr. R. S. Nevill, Tobacco Expert, so that the more scientific side of the subject of Tobacco-growing may be first studied by our readers. Mr. Nevill writes as follows:—

TOBACCO-GROWING.

Preparation of plant-beds.

"I wish to say in the beginning that improved methods do not imply more labour, but they do imply more painstaking. It means the taking advantage of favourable conditions or creating conditions that are needed, and, more than all, it means the getting of exact results, leaving nothing to chance. It is not necessary to give the many reasons suggested to show that plant beds well-burned give the best results, except to say that it destroys the vegetable and insect life, and permits the plants to occupy the entire soil undisturbed. Select for your seed-bed fresh land on a hill slope, where it will not be shaded, and near water not subject to overflow, as the land will be moist and need less watering. Black soil is to be preferred, as it absorbs a greater degree of heat.

Clear the ground of undergrowth and stone, and then put on a layer of brush and leaves to the thickness of two or three feet, and then on top of that put wood and logs, covering it well over, so that when it is burned off it will leave a heavy bed of coals.

The ground should be burned until it is red or brick-dust colour in order to destroy all seeds and insect life, and so as to completely pulverise. Do not burn when the ground

wet. When it has cooled, rake off all unburned wood, but allow the ashes to remain on the bed, and then spade it up to the depth of 6 inches, being careful to reverse the soil. It should then be well chopped with a hoe and raked until the ground is thoroughly pulverised and the ashes well mixed with the soil, all sticks, roots, and stones, being removed.

Do not make the beds too narrow, as they will get too dry; 6 feet is a very good width, but they may be as long as desired. Sow a teaspoonful of seed to 100 square yards of ground; this will make the plants thick enough, as the quantity of seed will yield 12,000 to 15,000 plants. A teaspoonful will hold from 18,000 to 20,000 seed, and a yield of 75 per cent. is as much as the best seed will give. It is better to have the plants too thin on the bed than too thick, as crowded plants grow weak and spindy, having no strength to overcome changed conditions; and when transplanted many of them die. They do not start to grow readily, and are more subject to the ravages of cutworms and other pests, causing many missing plants, making your field very irregular in growth, and entailing much extra work in topping and cutting, as the field ripens irregularly. But if plants are thin, they grow stocky, with good roots, and are strong and healthy growers, requiring less moisture when transplanted. They grow off readily, soon getting out of the way of pests, and you have a more uniform field of topping and at cutting time.

If you desire to test the vitality of your seed before sowing, take a few on your fingers and sprinkle them on the stove; if they are good they will pop and crackle, but if not they will burn and crumble away. When ready to sow your seeds, mix them with cornmeal or slaked lime, as this will show on the bed, and you can see what you are doing. Lime is preferred, as it is a good fertiliser. After sowing do not rake, but tramp or pat in the seed with the back of a spade.

Do not sow all your seed at once, but at intervals of two weeks, that you may have plants of the proper size for transplanting when wanted; sow more than you are likely to need, that you may be able to select the strongest and best plants. In order to keep your plants free from disease and insects, and to get the very best results, it is necessary to canvas your beds. Take boards and set them on edge all around the bed, driving stakes on either side to keep them in place, and thus form a box around it, closing the joints with earth so as to make them insect-proof. The boards should come 5 or 6 inches above the top of the bed. Drive a row of nails on the outside of the box, 10 or 12 inches apart, all around, leaving 1 inch projecting; have a sheet made, of the thinnest cheese cloth, the size of the bed, with holes around the edges to correspond with the nails driven into the box; stretch this this sheet over the bed, slipping the holes in the edges over the nails. If the bed is large, lay small poles across the box frame at short distances, to keep the covering from sagging. Be sure to get the very thinnest cloth, that light and air may penetrate.

This covering usually stays on all the time until the bed is abandoned; but watch your plants, and, if they do not appear strong and healthy, you can remove the covering during the heat of the day, say, from 11 to 3 o'clock, when insects are not moving about. Make a ditch around the bed to carry off the water during rainy weather. If it is necessary at any time to water the plants, it should be done about sundown; the covering laid off, and, as soon as the watering is finished, replaced.

It is best to draw the water for this purpose in the forenoon, and let it stand in the sun and get warm, as cold water chills both the plants and the soil. It will be found that a canvas-covered bed retains the moisture better than any other, and also induces a more uniform temperature.

If you desire to fertilise the plants, it is better to use liquid manure, either stable or chicken-house, the latter preferred on account of the lime in it; and care should be taken not to have it too strong, or it will burn the plants. To make the liquid, take a barrel of water, put in the manure, and stir until dissolved. If the farmer will follow the above directions, he will have healthy vigorous plants that will stand transplanting, will grow off readily, and free from insects, and I believe blue-mould will be unknown in his beds. He will have a start ahead of the insects, and will find that he will get his crop to grow with less labour.

BRAZILIAN COFFEE AND THE PLAGUE.

Allusions to the bubonic plague are sprinkled freely about the issue of the *Brazilian Review* dated 24th October 1899. There is apparently a doubt as to whether the disease noticed at Santos is the plague at all, and at any rate the town has not been isolated. We read that Coffee continues to go forward as before, or even more feverishly, nor is there any reason to fear that it will fail to do so in future. Cables received by the most important shipping firms state that no impediment will be put by the respective Governments to the entry of coffee at either New York or Hamburg; nor is there any reason to suspect that the other great distributing market, Havre, will act differently. At Santos on Tuesday, the 17th October, "when Rio people, especially exchange speculators, showed so much concern about our welfare by putting the rate of exchange down by leaps and bounds, the sanitary commission, aided by several doctors in government employ, undertook further investigations, pathological, bactereological etc., and in the afternoon we got the startling news that the death certificate of a dock-labourer declared the *causa mortis* to be bubonic plague." Yet there are doubting Thomases at Santos still. However, as the *Review* observes:—"Anyhow, whichever way you look at it, it seems equally fatal, seeming to kill in 24 hours and to be positively contagious." In its money review of the 21st October, the same paper remarks:—"That exchange had taken a turn for the better on Monday is not to be disputed. The current was directly upwards and speculation recognising the fact changed its tactics and commenced selling. On Tuesday the first reports of something wrong at Santos were received and things changed immediately; from being at least hopeful, if not optimistic, the market abandoned itself to despair and rates commenced to slump. At first the most exaggerated ideas of the effect of an epidemic upon exports obtained currency, and even as these wore off, the feeling of hopelessness prevailed. It must be confessed that the fates have not been kind of late: that in spite of Government's doing its best and religiously burning paper money, things get more and more contrary every day, and what with coffee stuck in the mud, the crisis in the European money markets, the peste-bubonica is after all but the last straw that forces us to review the whole situation. Is it possible, it is being asked, that a country in such circumstances should resume the suspended burden of its foreign debt again in 1901? No, it is not. Unless things take a considerable change meanwhile it will be impossible

for the Government to renew payments by the stipulated time. There are, however, good reasons to believe that there will be a change: that so soon as the present cause for weakness disappear, the improvement will be solid and lasting because wrought by our own resources without outside assistance of any kind. Meanwhile the reaction is certain as soon as things settle down again, as the firmness with which rates closed this evening unmistakeably indicate. Produce of every kind is going rapidly forward and sterling prices improving abroad, whilst imports are diminishing and consequently the demand for bills."

In the "Coffee Market" section we read :—"There is no reason for the present, at any rate, to expect that entries will be much interfered with in consequence of the pest. Should Santos by any chance be isolated entirely, so long as Rio were free, São Paulo coffee would be sent here over the Central Railway. Should this occur there would probably be some delay in delivery as the Central Railway would be entirely unable to deal with 40,000 bags per *diem*. The probabilities are, therefore, that although a little more São Paulo coffee may find its way here than usual, the great bulk will continue to go to Santos so long as shipment there is possible." Yet again, "the freight markets" bring the same matter under consideration, and it is remarked :—"The leading shipping agents of this city are unanimous in believing that however the shipment of coffee from both this port and Santos may be delayed in consequence of the appearance of the pest at the latter, there is no reason to expect any stoppage even should it develope into a serious epidemic." It is clear, therefore, that the plague scare has exercised a very disturbing influence, and that hopes and doubts are mingled in the minds of coffee merchants, shipping agents, etc., in Brazil.

In India, at least so far as coffee districts are concerned, the ravages of plague this year are comparatively mild, but the epidemic cannot yet be said to have run its course.

THE BATTLE OF THE BEVERAGES.

In the United States, as in the United Kingdom, progress may be said to be positive with Coffee, comparative with Tea, and superlative with Cocoa (and Chocolate). We commented the other day on the latest Board of Trade returns for the United Kingdom. Now, we read in the *American Grocer* that, notwithstanding that chocolate is subject to a high duty, it seems that the imports of the article are increasing. In September they were 103,985 pounds, against 88,789 pounds for the same month in 1898 ; for nine months ending September, 1899, they were 711,212 pounds, against 670,959 pounds for the corresponding time in 1898, and 78,049 pounds in 1897. Again, the imports of cocoa show a large gain over previous years. For nine months ending 30th September 1899, they were 28,926,474 pounds—a gain of over 10,000,000 pounds over the same time in 1898, and 8,000,000 pounds over 1897. In only two previous years have the imports for the entire year exceeded the imports for nine months of 1899. The cocoa industry is growing fast.

This is not exactly pleasant reading for tea and coffee-planters, but they are growing accustomed to the receipt of tidings such as the above. More cheerful is the news concerning Coffee. The Government Report, issued by the United States Bureau of Statistics, gives the total imports of coffee for the first nine months of 1899 at 671,759,324 pounds, a gain over the same period in 1898 of 39,895,835 pounds and 91,706,483 pounds over 1897. Brazil, of course reaped most of the direct advantage from this, as she furnishe 4,990,008,217 pounds, or over 74 per cent. of the total import As, however, this takes very large supplies of Brazilia Coffee off other markets, Indian planters need not lamen because the above percentage has risen 3 since 1897. appears that the imports into the United States from countrie growing mild coffee do not increase over previous year The imports from Mexico, Central America, the East Indie and other South American countries than Brazil have no been as large as in 1897. Mexico is behind the record fo 1898 ; Central America about 9,000,000 pounds ahead ; th East Indies 2,469,269 pounds less, while there is a differenc of little over three million pounds between the imports fro South America, other than Brazil, in favor of 1899.

TEA FROM SEED TO CUP IN SOUTHERN INDIA

(By Thomas Brown, Glendale, Coonoor.)

XXII.

Rolling.—The old system of performing this operatio was by hand on tables ; sometimes roughened a little, bu generally smooth. For fine teas, a finishing by hand is sti necessary to get the pretty curl, peculiar to good tea. quantity of leaf is taken into the hands and rolled alternatel first with one hand, then with the other, in a manner simila to the kneading of dough. It needs a little practice to kee the leaf together in a ball, a rolling twisting motion bein needed to accomplish this. Pressure is obtained by th palms, the fingers forming a hood to hold the leaf together The ball is broken up from time to time, and coarse leaves that do not readily roll, are sorted out to be separately dea with. This shaking-out exposes every leaf well to the actio of the atmosphere, which is so necessary for the efficien oxidizing of the leaf. Rolling is continued until the sa exudes freely, indicating a breaking-up of the cells. Shoul the leaf be under-withered, the excess of sap prevents efficien rolling, a simple and efficient remedy being to squeeze ou the sap into a vessel and to allow this to oxidize separately returning it to the roll before firing. Very flavoury teas ar in this way obtained. Similar treatment of leaf in roller gives most gratifying results, the tea being much better i every way.

In Machine-rolling—the roller is filled with the fu charge of leaf and the machine started. Rolling continue for from 40 to 60 minutes, the latter being more genera than the former. The pressure upon the leaf, while in th roller, must be most gradual and continuous, until the weigh will go down no more. Pressure should then be relaxe completely and the whole mass allowed to break up, afte which gradual pressure is resumed and so on for the ful 60 minutes.

Teakwood Trollies—running on rails should be provide under the rollers for quickly discharging and removing th rolled leaf. The pinewood trolly supplied by some maker is quite useless and had better not be purchased. It is fa better to make the trollies locally or order them of th required size from a good coast firm.

Pinewood in Tea Rollers—too, is most objectionable an must be removed and replaced by good teak. Before order ing a roller always enquire if there is any pinewood about it. It is most unfortunate that any firm ever turned out roller

with this wood. We have been sadly taken in this way and have had to have the whole of the woodwork remade at considerable cost. Our pinewood trolly was never used and lies with the lumber after costing £3. It will be as well here also to sound a note of warning *re* the cheaper form of Little Giant Tea Roller. This has not the hand-driving accessory, and is quite unsuitable for small estates where there is no power. Several are in difficulty from not being aware of this.

Heating in Rollers—must be carefully guarded against, and, should much heat be generated, the speed must be reduced. A great amount of heat is soon generated in every large roller and for this reason it seems advisable to have a series of small rollers in preference to on a large one. The loss from extra coolies is more than compensated by the higher prices obtained.

A second Rolling—is advisable always. This should be put on as soon as the roll shows a decided change in colour, not before. The time will vary with the leaf and the weather. Usually two hours must be allowed from completion of the first roll. From 15 to 20 minutes will suffice for the second rolling, and it is usually ready to go into the drier at the end of 20 minutes more. It is impossible to fix the time for these operations. A good deal will depend upon the style of tea required.

Oxidation—or as it was formerly called, fermentation, is a process all decaying animal and vegetable substances go through after death. It is taking place from the moment the leaf is severed from the bush: slowly so long as the leaf is not bruised; rapidly after masceration. Withering quickly by means of heated pans, rolling immediately, and then drying off, gives us green tea. For the leaf to oxidize well, it is necessary that the masceration be complete. Parts of the leaf not mascerated will remain green or turn a blackish greenish colour. The same thing will happen to leaf that catches the sun or is over-withered on the racks.

Pungency—depends on the extent to which the leaf has been oxidized. The oxygen of the atmosphere having a strong affinity for the tannic acid of the leaf combines with it and forms an insoluble compound that goes to the bottom of the tea pot (if the union has been complete); hence the longer we oxidize the less pungent will be the tea, and *vice versâ*. The presence of a large amount of soluble tannic acid is indicated by the liquor creaming in a short time after getting cold. Teas that are tasteless and inferior never cream even if left standing all day. The application of a little heat to a liquor that has creamed will immediately restore it to its original colour.

For London—creaming liquors are needed absolutely. It appears to us that the damp English climate causes the tea to oxidize somewhat, even in the dry condition and so reduces the astringency so much sought for by London brokers. The consumer is fast learning that astringent teas are not good for his stomach, and we hope soon to see a decided leaning towards the softer produce of Southern India. The Germans appear already to show a decided leaning towards well-made South Indian teas, and prices for these should rise. Too long have we suffered by the undervaluing of our teas, but the public taste is our hope. For our smaller produce per acre, we need higher prices than districts where produce is fully double what ours is.

Trays of Teakwood—30 inches square, 3 inches deep, are the best for oxidizing in. These should run on two-angle iron pieces fitted into a wall in a separate cool room, the temperature of which should be kept at 85°. Curtains hanging in front should be kept constantly damp to prevent drying of the leaf, and to provide a moist atmosphere for the roll.

Various other means—are adopted for securing a good colour, a few estates having secret plans of their own by which they hold. The matter is full of difficulty yet. That which we here recommend will be found both cheap and efficient.

Turn the Roll—over in the trays from time to time and for this purpose set them about 12 inches apart on the wall, so as to admit the hands freely. A ladder to reach up to the higher trays will be required.

For the Washing of the Rollers—washing soda, that can be had very cheaply down at Madras, will be found very good. Great care should be taken to see that the rollers are cleaned daily and dried off. All oil spilled about should be carefully wiped with waste.

Nails in Rollers—frequently work great mischief, tearing the leaf to bits. These should be attended to and driven down every week, a small punch being used to drive them below the level of the wood.

A Roll Breaker and Sifter—may be used to separate the coarse unrolled leaf from the fine. Messrs. Davidson & Co.'s machine is the best for the purpose, performing its work noiselessly. We do not recommend the use of such a machine, as but little good results from it. The flavour of the coarse leaf has already permeated the fine and after separation accomplishes but little. Much fine tea adheres to the coarser leaves, while broken portions of coarse leaves go through the mesh with the fine It is difficult to keep such a machine clean, as can be readily seen, and a good deal of the sap is taken away from the leaf, forming a thick crust on the mesh and other parts of the machine. The old style of rattlers used in Ceylon are an unmitigated nuisance, making a continual and fearful clatter the whole time and spraying oil plentifully over the leaf!

Quality of leaf—is after all what makes fine tea chiefly. Manipulation in the factory will not "make a silk purse out of a sow's ear"! For fine teas, grow fine leaf and pluck fine, and the result will be, with ordinary care, most satisfactory. If we grow Brussels sprouts, we cannot expect sugar-loaf cabbages. It is much to be hoped that the tea-bush will soon receive the tender care that the coffee tree does: then only can uniformly satisfactory results be obtained. We do not hold with those who say that manuring spoils flavour. As well say that tea grown on a laterite ridge is better than on a chocolate loam!

NOTES.

A Water Famine in Wynaad.

Fears are entertained in Wynaad that there will be a water famine this year. A correspondent informs us that everything is already as dry as an ordinary March.

Tea at the Paris Exhibition.

Mr. J. H. Renton, the Commissioner for Ceylon, asks for exhibits of golden tip and silver tip, bulked. The Indian Tea Association proposes to give away a large number of sample packets of tea.

Excitement. A Home paper remarks :—"We have seen Coffee almost excited over a private wire transmitting the statement that the Rio crop would not exceed 2½ million bags." Certainly, to use a Hibernicism, the sender of that message "went the whole hog in his attempt to bull the market."

The Future of Coffee. In the columns of the *Madras Mail*, and in our own, a good deal has been written of late on this subject. The letter from Messrs. W. H. Crossman & Bro., of New York, that we publish to-day, will give "Coffee-men" food for much thought. We can but hope that it is the letter of men whose pessimism is beyond redemption.

Quinine and War. The *Medical News* says that more than 125,000,000 gr. of quinine have been taken by United States soldiers during the past year. It is said that some of the military patients in the hospitals in Cuba and Porto Rico took as much as 300 gr. a week during several weeks. Hardly any of those who were in service in the West Indies failed to take some quinine during their stay.

The London Tea Market. Cabling to Colombo on the 7th instant, Messrs. Gow, Wilson and Stanton reported a generally steady market. Fair liquoring Ceylon Pekoe Souchong, 6¾d.; average of Ceylon Teas for the week, 7⅛d. (unchanged). According to Reuter, 21,000 packages Ceylons and 35,000 packages Indians were sold out of 23,000 and 39,000, respectively, offered. The average price of Indian teas was 8d. (¼d. down).

Calcutta Tea Sales. Arrivals at Calcutta showed a material decrease last week, the quantity catalogued being 13,875 packages only. A much larger section of Darjeeling tea is on offer than has been shown for several weeks, few, however, being really fine. Duars teas continued in fairly full supply, although rather brown mixed and stalky. Cachar and Sylhet teas show signs of somewhat coarser plucking. Assams remain unchanged.

British-grown and China Teas compared. In a letter to the *Ceylon Observer* by last mail "Suum Cuique" writes as follows with regard to the position that Ceylon teas hold as they are turned out to the consumer at home :—"I may repeat that good China teas are now occupying the position, that good Ceylons occupied some years ago. British-grown teas have been blended and blended, until their individual character has gone and history is repeating itself."

New Economical Plants of East Africa. The *Notizblatt*, of the Berlin Botanical Gardens, says that one of these is a tree of the N. O. Apocynaceæ, viz., *Mascarenhasia elastica*, K. Schum., which yields caoutchouc. Another is *Canarium liebertianum*, Engl., the bark of which yields a resin that much resembles *olibanum*. Another is *Erythrophloëum guiniense*, Don, the wood of which is valuable and the bark contains *erythrophloëin*. The fruit of *Cordyla africana*, Lonr., yields an edible leguminous fruit.

Coffea stenophylla. Among a large quantity of seedlings raised in Trinidad from *Coffea stenophylla*, three were noticed which had larger and broader leaves than the rest. These were planted out, says the October Bulletin of the Botanical Department, and are growing freely. They have now leaves twice the size of ordinary *C. stenophylla*, and certainly show a very wide margin of variation over the type. It is possible, of course, that they may be chance hybrids ; but this cannot be seen until they have flowered and fruited. They are nearly twice the size of type specimens sown at the same time.

Attar of Roses. The growth of roses for the production of rose oil is most abundant in Arabia, India, Turkey, and Bulgaria, and within recent years has been introduced into Germany by Messrs. Schimmel & Co. Turkish rose oil, to the extent of 80 per cent, consists of geraniol and citronellol in the proportion of 3 : 1, and also contains a stearoptene, $C_{16}H_{34}$. Geraniol, $C_{10}H_{18}O$ is obtained from Indian geranium oil, and is employed in adulterating rose oil ; citronellol, $C_{10}H_{20}O$ is derived from citral, the aldehydic constituent of citronella oil. German rose oil contains a greater proportion of stearoptene than the Turkish essence.

Tea Drinking in America. The *Ceylon Observer* refers to the criticism of a Ceylon gentleman in the United States, who writes :—"I have not yet tasted a good cup of tea in America. In the restaurants of New York, and even in private houses, where everything else is of the best, the tea is worse than what you get in any of the boutiques on the way to Anuradhapura. I have seen advertisements of Nettley's Ceylon and Indian tea. They evidently mix the teas here, and, of course, the real flavour of our superior tea is altogether lost. The Planters' Association should wake up if they desire to save the reputation of Ceylon tea in America."

Seychelles Vanilla. The export of vanilla from Seychelles during October was very heavy, *viz.*, 124 cases, weighing 10,380 kilos., all of which was shipped to London. It is understood, however, that about 2,000 kilos of this would be immediately re-shipped to Paris. The prospects for next year's crop cannot be worse than they are now, writes the Seychelles correspondent of the *Chemist and Druggist*, and although we are almost in the middle of October, there is so far hardly a flower to be seen. This is due to excessive rainfall. Even if the weather improves our 1900 crop cannot be otherwise than a wretched one. Prices for what remains of this year's crop keep very high, 16·75r. to 17r. per half-kilo. being freely offered for whole crops, pickings, shorts, splits, &c., included.

Agricultural Possibilities of Mexico. In a letter to the Department of State from Consul-General John K. Pollard, at Monterey, Mexico, we find the following :—"Parts of the country are adapted to the growth of tropical products, *viz.*, coffee, vanilla, rubber, cocoa-nut, cocoa, etc., the quality of all being first-class. It is said the best vanilla in the world comes from the State of Veracruz, and the best cocoa from the State of Ghiapas. The coffee of Michoacan is said to be equal to any ; the tobacco of Veracruz is preferred by many to that of Habana, and the sugar production of southern Tamaulipas or northern Veracruz is said to be surpassed by that of no other country save Hawaii in quantity, and it is more profitable to the producers for the reason that seven to ten crops are the result of one planting, whereas the Hawaiian planters get only two. Taken

s a whole, farming in Mexico is an inviting field for persons of capital and intelligence."

Poisoning by Vanilla. Several cases of poisonous effects following on the consumption of articles flavoured with vanilla have been recorded, but if a report taken by the *British Medical Journal* from a German contemporary is to be relied on, the toxic symptoms are only indirectly traceable to vanilla. It appears from experiments that while fatal to certain microbes and innocuous to others that vanillin assists the growth of anërobic bacteria (tetanus, anthrax, &c.). In the case in question mineteen persons were of a rendered seriously ill and one died, subsequent to partaking cream flavoured with vanillin (produced from coniferin), the ingredients were all shown to be harmless by themselves, but the milk when flavoured with vanillin caused fatal results when injected into mice, and it was proved that the milk had contained anërobic bacteria, whose development had been promoted by the vanillin. It may be noted that cases of so-called vanilla poisoning have occurred, where the natural pod had been the flavouring agent.

Pepper. The reported damage to the Lampong Pepper crop by weevils, which it appears attack the vines, has received confirmation, and it is estimated about 30 per cent. of the growing crop has been destroyed. The Singapore black crop is practically exhausted, and fresh supplies will hardly arrive before January. It is estimated that the crop by the end of April will yield about 70/80,000 piculs. As to Tellicherry Pepper, opinions as to the ultimate out-turn of the crop greatly vary, but it may be taken for granted that the exaggerated estimates either *pro* or *con* emanate from interested quarters, and that the total will fall but little short of last year's crop. The total shipments from January to October amounted to about 5,500 tons, of which India absorbed one-half, and Europe and America, the remaining half. It is confidently expected that, with the approach of the winter, the position of Pepper will steadily improve, as the statistical returns are bound to exercise a stimulating effect upon prices.

American Tobacco. The leaf tobacco exhibit for the Paris Exposition of 1900 is now being prepared for shipment in the Division of Soils of the Department of Agriculture at Washington. According to the *American Grocer*, this will be without doubt the finest collection ever exhibited by the United States. It includes the varieties, grades, types, and qualities of tobaccos from all of the principal tobacco-growing sections of this country. This display will comprise only the raw material, supplemented by a large collection of photographs and, in a few instances, samples illustrating the different stages of the tobacco in the process of manufacturing. The collection will include about 1,000 samples, and will be ready for shipment early in November. The exhibit is to represent the various tobaccos of the United States, rather than the display of any particular firm. With a few exceptions, the samples are in duplicates, the duplicates to be reserved for the judges of awards. The tobacco exhibit will be accompanied by many photographs illustrating the tobacco industry from seed bed to finish.

Mocha Coffee. E. S. Cunningham, American Consul at Aden, makes the following report on Mocha coffee exports to the United States:—"Some time since a prominent merchant of Aden called my attention to a paragraph in an American newspaper in regard to Mocha coffee and its use in the United States. The paragraph contained this sentence: 'Indeed, there is practically no genuine Mocha coffee in our market.' This statement is quite unjust to American importers of the genuine Mocha coffee direct from ports of Arabia. As appears from the invoice books at this consulate and the consular agency at Hodeida, there have been invoiced for exportation to the United States during the year ending June 30, 1899, 32,156 bags (160 pounds each—5,144,960 lbs.) of Mocha coffee, I should think it but reasonable that at least 5,000 bags which are first shipped to Europe finally reach the American market without being mixed with inferior coffees. 'Doubtless, Mocha is mixed with cheaper coffee in Europe to a great extent, and is shipped to the United States as Mocha coffee; but it is hardly possible that an importer who buys his coffee at an Arabian port could get anything but genuine Mocha or Harrar coffee.'"

Ginger. The good demand which Ginger is at present enjoying is, says the *London Commercial Record*, wholly and solely produced by the glowing reports which continually reach us from the ginger-growing districts in India concerning the state and the prospects of the coming crop. Every year we have been treated to a tale of woe on the part of the planter, and we have naturally become somewhat sceptical and slow in believing these tales of damaged crops. But this year their outburst of grief seems to be fully justified, for we all know that the monsoon has been exceedingly poor, and that vegetation needing a lot of moisture, such as ginger, must have suffered greatly by the prolonged drought. Early in the spring this year, when unusual and exceptionally heavy rains visited the ginger districts, old Indians predicted—and we repeated their prophecy—a most unsatisfactory monsoon, and their prognostications have proved correct. It is now late enough to form a correct opinion as to the ultimate out-turn of the crop, and we believe that the moderate estimate minimum 50 per cent. short of last year's yield is a correct one. The quality will naturally be poor, although planters hope that rains which have recently fallen may improve the roots somewhat, but this is open to doubt. At any rate, leaving the root in the earth longer will considerably delay the arrival of new supplies.

The Germination of Seeds. The last number (420) of the *Proceedings of the Royal Society* contains an account of some experiments on the influence of liquid hydrogen on the germinative power of seeds, by Sir William Thiselton Dyer and Professor Dewar, which are of a very remarkable character. Sir William Dyer took seeds of *Brassica alba*, *Pisum sativum*, *Cucurbita pepo* (vegetable-marrow), *Mimulus moschatus*, *Triticum sativum*, and *Hordeum vulgare*. The germinating power of the seeds from which these samples were taken was tested previously by Messrs. Sutton & Sons. These seeds were entrusted to Professor Dewar, who exposed them for half an hour to a temperature of — 250° C. All these seeds germinated at Kew. A second set of seeds were subjected by Professor Dewar to actual immersion in liquid hydrogen for six hours; whereas the first set were cooled in a vacuum, being sealed in a glass tube. The second set of seeds germinated as well as the first, although they had been subjected by Professor Dewar to the

almost inconceivably low temperature of —453° Fahr. below the temperature of melting ice. On the contrary, protoplasm is known to be disintegrated by a temperature of 75° C. (167° F.) : and if seeds have germinated after exposure to a higher temperature than this, it must be because the investments of the embryo are non-conductors, and the extreme heat mentioned has never reached the embryo.

Tenacity of Life of the Coffee Plant.

Mr. D. Buchanan, late Manager of the State Experiment Farm at Mackay, Queensland, mentions the wonderful tenacity of life in the coffee plant. During the cyclone of February, 1898, the plants at his farm were levelled by a cyclone from the south-east. Two-thirds of them were killed outright, but all those that had any roots left were hauled-up and fastened to strong stakes. They were almost leafless, and fruitless, for the ground was strewn with both leaves and green fruit They appeared to be total wrecks. By January, 1899, they had made young wood 13 to 14 inches long, with fine large dark-green foliage, and were fast filling up the south-east sides of the stems that had been stripped of branches. Then came the second cyclone at the end of last January. This time from a point west of north. Although the bushes were tied to the post with strong tarred twine, the fury of the gale so chafed the twine that most of them were blown down again, and this time the roots were broken on the opposite side. Several plants had all their roots broken off, and of course were thrown away; but, where it was seen that there was still a root intact, they were pulled up again and secured to fresh stakes, and by the end of May they had shoots 20 inches long, fine dark foliage, and what berries were left were plump and ripening well. No doubt what saved them was the fact that they had made fresh roots on the south-east side, and these being flexible were not broken when the plants were blown down from the north-west.

LETTERS TO THE EDITOR.

THE FUTURE OF COFFEE.

SIR,—Monsieur Conty's account of the condition of the coffee industry of Brazil, given in "Coffee Planter's" letter in your issue of the 2nd instant, is very interesting; but your correspondent seems to lose sight of the fact that it is not a correct description of the present state of affairs. He quotes the price of average Brazil coffee at 31*s.* 6*d.* in *Santos*. This means a price of 37*s.* in London or New York when all charges are paid. Grade No. 7 Brazil Coffee has not been over 8 cents a lb. since April 1897, and 8 cents a lb. is about 36*s.* a cwt. In 1898 Brazil coffee was never over 7 cents, and every month of that year was as low as 5⅞ to 6¼ cents. In 1899 it was between 4½ to 6 cents.

	s.		s.
7 cents a lb.	= 31·36 a cwt. gross in New York & say	26/	cwt. net in Santos
6 "	" = 27/	"	" " 21/6d " "
5 "	" = 24/6d	"	" " 19/ " "

When the price in Santos is about 19*s.* a cwt., it is obvious that 10 cent per cent. profit on it at 31*s.* 6*d.* has nearly vanished, more especially as that profit is calculated without taking into account the proprietors' expenses and interest on loans and mortgages. It is probable, too, that Monsieur Conty's calculations were only for the best estates yielding hea crops. We know that coffee crops fluctuate in amount ve considerably from year to year, and an estate said to avera so many cwt. an acre, often gives that yield only in favoura years. To curtail production in Brazil, however, it is o necessary that the less favourably situated estates should put out of the running. That such curtailment is going is evident from the complaints in the Brazil papers as to t unprofitableness of the coffee industry at present, and fr the fact that the growing crop is put at only ten million ba in an exceptionally favourable season against eleven milli bags in 1897-98. If there were no such curtailment, all t young clearings coming into bearing we hear so much of, shou have made the production this year much larger than 1897-98. Meanwhile consumption has been so stimulated low prices, that it has nearly overtaken the average yield the three years of increased production, 1897–99. In oth words, the whole of the increased production in Brazil ma be required to meet the world's yearly consumption, and a falling off in that yield, such as is by no means improbab under the present conditions of scarce money and a sho labour supply, will cause prices to rise as they did in 18 under similar conditions.

W.

COFFEE.

NEW YORK, *November 14th*, 1899.

DEAR SIR,—On the 8th instant, the Revision Committee the Coffee Exchange held their annual meeting, and decid not to make any change in the official differences betwe grades. This leaves matters unchanged for another yea the Exchange differences between No. 3 and No. 7 remai ing at 2 cents, and No. 4 and No. 7 at 1½ cents, whereas t *market* differences between those grades are only about on half the official figures. From this it is seen that buye of the *futures*, say, September, at 6 cents, will have to p 1½ to 2 cents additional, basis of No. 7 for the grades no delivered.

In September last, option contracts, with same differenc as now exist, were liquidated at about 4·25 cents, yet spec lators are paying about 6 cents for September options in fa of the certainty that supplies of Coffee throughout the wor will be larger in September, 1900, than last September.

The reasons for the recent advance were entirely sen mental.

The first advance was created out of sympathy with t higher values for Cotton. The Cotton crop, originally es mated at 11,000,000 bales, or more, has been reduced about 9,500,000 bales. The current Coffee crop in Rio a Santos was estimated 9,500,000 bags, but according to receip so far, it looks likely to run in excess of 10,000,000 bags- practically opposite results in the two articles, yet sentimen decides for an advance in Coffee, because higher values a reached for Cotton !

The next advance in Coffee was engineered on the repor of Bubonic plague in Brazil. There is no doubt there we some cases of this disease and some still exist. It has n been epidemic, simply sporadic, of the same character as appeared in the River Plate in August. It has not interfer with receipts or shipments of Coffee, and Consular reports the United States Government show it is not nearly as dange ous as occasional outbreaks of yellow fever have been. B

for sentimental purposes in the Coffee market the word "Plague" was sufficient, the correct details or the fact that it played no particular part in regard to Coffee were disregarded—the reasoning process is not wanted.

Reports about Italian laborers leaving Brazil in large numbers furnished another excuse for an advance in Coffee. We understand that a number of Italians annually leave Brazil after the picking of the crop, but just as many and even more return for that work. An instance is quoted of the steamer *Colombo*, which arrived in Genoa from Brazil, October 7th, with 300 Italians, and left Genoa again for Brazil with 1,500 immigrants, October 23rd. Whatever the facts or changes may be in these matters, there is no shortage of labor when 3,600,000 bags Coffee can be moved and marketed in four months as was done in Santos this season.

Another point sentiment has exploited is the statistical decrease in the world's visible supply for October of 337,000 bags. This has been represented as consumption overtaking production, but in truth it is just the reverse. The total quantity of Coffee that came into sight at or from producing countries during October was 1,450,000 bags.

Deliveries for the 1897-1898 season averaged 1,214,000 bags per month.

Deliveries for the 1898-1899 season averaged 1,123,000 bags per month.

Does anyone believe the world *consumed* 1,712,000 bags Coffee because that quantity figures to have been delivered?

Instead of the world's supply of Coffee decreasing, the interior (or invisible) supplies have increased about twice the quantity of the visible *statistical* decrease. Deliveries in Europe and the United States are no proof of consumption. *Deliveries* include the large quantities of direct importations from Brazil, which are always heaviest at the height of the crop season, while the quantity of speculative purchases, put down as consumption, depend upon the price and feeling prevailing.

Does anyone believe that consumption in 1898-1899 was about a million bags smaller than the previous season, 1897-1898, because the *deliveries* showed that much decrease?

If statistics for the month of October are analyzed there will be seen a discrepancy of 193,000 bags, taking the Rio and Santos stocks and receipts, less the shipments, compared with the stocks remaining in Brazil. Heretofore statistics were correctly kept in Santos by deducting shipments from stocks, when actually cleared. The Rio shipments are never properly cabled, the stocks being reported less *purchases*, instead of following the safer method formerly used in Santos. But Mr. John Jones has chosen the defective system for Santos too, which makes it possible to lose sight of one or two hundred-thousand bags of Coffee in those ports in a month. From New Orleans, La., the stock on November 1st was reported as 10,000 bags, whereas actual stocks in public warehouse there are considerably more than 100,000 bags. Thus *statistics* are wrong, and instead of a decrease in the *visible* of 337,000 bags on November 1st, correct figures would show the visible about 8,000,000 bags in spite of the unprecedented deliveries of 1,712,000 bags in Europe and the States, only once before approached, in April, 1898, when the duty scare started here. If sentiment was controlled by reason, sentiment would also analyze figures and prove the results we explain above; but sentiment spreads, runs its erratic course and collapses long before the calm mind can detect any merit in its claims.

The low value of Coffee results from over-production. Sentiment of the kind lately exhibited actually stimulates production. The only real help for genuine better prices for Coffee is diminished production.

Up to now prospects of the growing crop in Brazil are reported favorable. Not a single exporter of good standing in Brazil reports the slightest doubt of this, yet we all know how popular it is in Brazil to report disparagingly on the crop on the least excuse, while it is most unpatriotic or unpopular to cable the truth of encouraging prospects.

On the weight of supplies alone Coffee values declined to the lowest point, say—

In Havre,	Sept. '99 Frcs. 31.	but sentiment last week put	Sept. 1900 at Frcs. 40.
In Hamburg,	„ „ 26 pf.		„ „ „ 33 pf.
In New York,	„ „ 4.10c.		„ „ „ 6·10c.

and this in the face of indications of larger supplies next September than ever known before, with the 1900-1901 crop, if anything, in excess of the present—which shows positively that over-production is in full swing. The Coffee trade must remember bull sentiment does not consume Coffee, but higher prices so created stimulate production. Coffee values finally are not decided by sentiment, but entirely by supply and demand, and it is probable the present sentimental rise will bring the same experience that has attended the different attempts to lift values artificially during the past three years.

Prices of Frcs. 37·50 in Havre, 31 pf. in Hamburg and 5·50c. in New York may appear low to the average mind, especially the outsider, but the prices Brazil gets to-day are not low, Rs.45$000 to 50$000 per bag, according to quality. From 1882 to 1886 Brazil received only Rs.15$000 to 20$000 per bag, and in the years of high prices in consuming markets, with extreme Sterling Exchange rates in Brazil, say, 1888-1889, the Milreis price was from Rs.30 to 38$000 per bag. As the price in Brazil is the basis for smaller or larger production, a high figure in Brazilian currency is at once a danger signal for still further increasing production.

W. H. Crossman & Bro.

GENERAL ARTICLES.

AUXILIARY PRODUCTS: PEPPER.

"Producer" writes to *Capital*:—

Pepper is a very ancient staple of Malabar and was a monopoly under the rule of the Dutch, Portuguese, and the Honourable East India Company. Till some fifteen years ago it was grown only in the low country, but has since been proved to do well at 2,500 to 3,000 feet above sea-level, and even up to 3,500 feet. There are at least six or seven varieties of cultivated pepper, and two are three of wild pepper, which latter are found in primeval and secondary forests up to about 3,000 feet. The wild varieties are valueless, and only two of the cultivated are worth planting. The good kinds are the Balamcottah and the Kullyvully. The former has a large pale leaf raceme and berry, and is the heaviest cropper in suitable places and favourable seasons. The latter has a smaller dark green leaf raceme and berry; the berry is heavier, the vine is more hardy, and does better at the higher elevations; and it is a more certain cropper in unfavourable seasons. Both came from Tellicherry, which produces the best pepper in the low country of Malabar. Good kinds of pepper have broad rounded leaves (with small sharp points), which give a delicate aromatic odour when crushed, and the young shoots have liver-coloured tips. Bad kinds have small, narrow, or elongated leaves which give a coarse rank smell when crushed, and the tips of the young shoots are white or pale. Buchanan in 1802 mentions that pepper was grown chiefly on the Maurica (*Coral tree—Erythrina indica*), and this is still largely used, especially on land bare of trees, as it grows readily

from stakes. The best standard is, however, the jack (*Artocarpus integrifolia*), and next to it the Indian varieties of fig which have a rough bark. Almost any hardy tree, however, with a rough bark will make a good standard. The silver oak (*Grevillea robusta*) grows readily in almost any land, and is a good standard after its bark roughens in the fourth or fifth year from planting. Pepper keeps constantly slipping down off smooth bark trees, but can be made to climb them by nailing narrow strips of bamboo to the bark vertically and about six inches apart. What is desired is a tree with a straight slender stem with a small head, and trees with big heads, like the jack, must be well-lopped as soon as the pepper vine is established. For the first three years a considerable amount of shade is beneficial to prevent the young vines dying in the hot weather. After the fourth year the standard must be lopped to admit plenty of light and make the vines bear from top to bottom. Without plenty of light the crop will be very small, but it is a mistake to remove all the shade as some advocate, as pepper is naturally a shade creeper, and, though it may bear heavily for a short time in the open, the vines are apt to suffer. Besides excessive lopping is apt to kill the standard, when the vine also dies. About 25 feet apart is the best distance for standards, or say 100 to the acre, and abandoned coffee clearings, regularly shaded in this manner, form ideal sites for pepper clearings. Pepper is also planted amongst shaded coffee, and if the trees are far apart no harm results, but if very close the coffee soon becomes unproductive. Still a coffee clearing which is becoming unremunerative may be made to give good profits again by planting pepper.

The cost of planting pepper, when standards are established and cuttings have not to be purchased, is very small. About Rs.5 to Rs 6 an acre the first year and rather less for succeeding years. The vines need only be weeded for some 4 to 6 feet round the tree, and earth carefully heaped up over the roots twice a year, once before or during the monsoon and once as the hot weather sets in. The land may be grazed by cattle to keep down the exuberant growth of grass. In open land, when Maurica stakes have to be planted and cuttings purchased, the cost will be about Rs.20 an acre for the first year and Rs.10 for succeeding years. About 1,000 cuttings per acre are required, as only about 33% can be relied on to grow, and the price this year was Rs.5 per mille. for the best sorts. These are planted three or four in a pit, 6 inches across and 18 inches deep. Two to eight pits are required to each standard according to its size. The cuttings should be two feet long, care being taken to make the cuts immediately above and below a knot.

The cuttings should be put one foot deep in the pit, and the earth pressed firmly round them, or they will die. The earth should be banked up over the pit, and a small trench, two inches wide, left between the stem of the standard of the bark to prevent superfluous moisture entering the pit. The knots on the upper foot of the cuttings should be pressed, or tied firmly against the standard, as it is from these knots the roots come which cling to the standard. It is best to plant only in showery weather, though, provided they are shaded and rain follows in a short time, pepper cuttings may be planted in airy but very wet weather. Pepper is readily grown from seed, but the natives assert, and European experience proves, that vines from seedlings take much longer to come into bearing than those grown from cuttings.

Pepper begins to bear in the third or fourth year from planting, but the yield is very small. About the fifth or sixth year about two cwts an acre may be gathered, and from the tenth year an average crop of about four cwts per acre. Individual vines yield much more than this, 2-5ths of a cwt. per vine being not uncommon, and record yields of 1 to 3 cwts. of dry pepper from a single vine being known. A vine which gives the latter yield however really equals 4 vines of 20 feet or more high each, one in the stem and three in the branches of the standard, and such huge standards could not probably be grown more than 5 or 10 to the acre Europeans picking 15 to 40 tons a year from fairly large acreages but the average yield from vines over ten years old at 3 to 4 cwts. per acre. Pepper; like other fruit crops, varies from year to year with the season, and a larger yield will probably be followed by a smaller. At present prices, say 5d. a lb. net in London, 4 cwt. is a very paying crop; but it must not be forgotten that only two years ago the price fluctuated about 2d. for two or three years. 1½d. per lb. is said to be the cost of laying down pepper in London, but this cost would, of course, vary with the crop and the locality. Some Europeans manure pepper with cattle manure dug into the ground at some distance from the standard, as, if applied directly to the roots, it is thought to be apt to kill them and the vine. Natives say leaves and earth well heaped over the roots are all the manure that is good for pepper. It will be seen from the above that pepper is not a crop which will bear the cost of a heavy establishment, but, grown in conjunction with other products, it may at a pinch bring in a welcome sum of money. When coffee prices were down in 1882-5, pepper was as high as 6d and 8d a lb. and now coffee is down again, pepper, has experienced a welcome rise. For those who have suitable spare land it will grow almost while they are sleeping, as it requires little attention. The fact however, that the crop ripens with a rush at one time, and is all over in a month requiring a large labour force for a short time, would make it difficult to manage a large acreage. It must be picked green as a rule, as soon as the foremost berries turn red. and dried into black pepper. If left to ripen, probably much of the crop will be lost unless there is a small crop and an ample labour force. White pepper is made from ripe pepper husked. Finally, pepper requires a sheltered position, will not stand much wind, and does best in hollows.

TARING RULES AT THE LONDON CUSTOMS.

The following letter has been circulated by the Ceylon Association in London :—

LONDON, 15th November, 1899.

W. Martin-Leake, Esq., Secretary to the Ceylon Association in London, 61, Gracechurch Street, E. C.

SIR,—I duly submitted to the Board of Customs the letter of the 1st instant, signed jointly by yourself and Mr. Ernest Tye, Secretary of the Indian Tea Association, expressing the acquiescence of the Indian and Ceylon Tea Associations' Joint Committee in a Draft Order which the Board have it in contemplation to issue in respect to the taring of teas, for purpose of the Customs' Landing Account with an added half-pound weight in the scale, and I am now instructed to acquaint you, for the information of the Joint Committee, that the Board, with the approval of the Lords of the Treasury, are now about to issue an Order in the terms of that Draft, such order being in the absence of any expression of opinion to the contrary on the part of importers of China teas, made applicable to teas of all kinds, instead of being limited, as originally drafted, to teas from India, Ceylon and Java.

The Board propose, also, to take the opportunity of the issue of this new Order, to introduce into it a direction for an increase in the number of the "tarers" taken for averaging as already agreed to by letter from this Office of the 14th August last on the proposal to that effect as contained in letter of the 4th preceding, addressed to the Board by the Indian and Ceylon Tea Associations in London and the Tea Buyers' Association, jointly, and it is intended to bring both of these new rules into effect on and after the 1st proximo.

I have also communicated to the Board the substance of the conversations which I have recently had with you and other representatives of the tea importers, with respect to the point in discussion between yourselves and Tea Buyers as to the establishment of a rule for the separate taring of each package of tea bulked in Bonded Warehouse in London, *i. e.*, in effect, abrogating that portion of the Board's General Order 102/1894 which authorised the retention of average tars for packages of bulked teas as an alternative to the separate taring of each package. as well as of the substance of interviews which, as you are aware, I have correspondingly had with representatives of the buyers.

The Board, having thus been put in full possession of the views held by the different branches of the tea trade on this subject, regret to find that there is not, with respect to it, such a decided preponderance of opinion on either side as would justify them in the conclusion that, if they should decide to withdraw the alternative, such decision would prove acceptable generally to all the interests concerned, and would tend to prevent further controversy on the point.

Under these circumstances, therefore, and the matter being one which does not directly affect the interests of the Revenue in either way or the other, the Board are driven to the conclusion that the only course open to them is to allow the existing freedom of choice to continue, thus leaving it to the different interests concerned to

make whatever arrangements they may think best, within the range of the alternatives allowed by the rules of the Department for meeting their particular views.

It seems to the Board that those Members of the trade who have expressed themselves in favour of the separate taring of each package of bulked tea, have means at their disposal for giving adequate weight to their wishes without the intervention of this Department.

Whilst, therefore, it would afford much pleasure to the Board to give their sanction to any change in their existing Regulations which might be generally desired by the whole of the tea interests, so long as the Revenue was not affected, or material increase of expense thrown upon the Department, they think that they would hardly be justified, in the absence of a general agreement on the part of all the interests involved, in taking the step desired by certain members of the trade.—I am, Sir, your most obedient servant,

(Signed) R. T. Prowse,
14th November, 1899. Custom House, London.

PRODUCE AND PLANTING.

Low-priced Tea.—On the subject of low-priced tea, a correspondent of the *Grocer*, Mr. Hicks, of Leman Street, writes:—"Some time since you were kind enough to insert some letters for me upon the position of the tea market and the inadvisability of pushing low-priced tea. I pointed out then that no provision was made for a rise in the market. The position to-day is one which is worth the attention of every grocer. The facts are that, with a low exchange, some three years ago, and a considerable amount of over-production, tea reached a very low level, and a very uneconomic one The rate of exchange has greatly increased, making it quite unprofitable to sell tea at the prices which ruled some time ago. At the same time, the consumption of tea abroad has largely increased. The stocks of China tea, which used to be a large factor in low prices, have been consumed, and as practically there is nothing to be seen on tea laid down under 6d. in London, there is no reason why for some time the market should be under that price. Up to the present time high prices have generally produced large supplies, but as parts of some tea plantations have actually been abandoned, it does not seem as if there were any new inducements to put new ground to tea to any large extent, and until that is done, and the tea is ready for picking, there is not likely to be over-production. After all, the shilling canister is not one to reflect credit either to the retailer or to the wholesale man, and, I think, that every retailer would be studying his best interests if he threw the weight of his influence with his customers into educating them to higher things. We hear a lot of talk about cheap tea, but tea is not a particularly cheap thing. It costs a good deal to produce, to place in chests, and lay down ready for the grocer, and a heavy exchange adds largely to the cost; and, with so many steamers taken up for transports, freights will be exceptionally high. It is difficult to see what the advantage ever was to the retailer to have tea advertised at a price which was practically impossible to maintain. There never was any real profit in ten-penny tea, neither was there any likelihood of there ever being any; and, as most people worship the god of low prices, it would no doubt successfully divert their purchasing powers from better teas in the direction of no profit."

The Brazil Coffee Market.—In its weekly report on the Brazilian coffee markets, dated October 31, received by the mail, the *Rio News* remarks as follows:—"The market has been much firmer during the past week, and prices have materially advanced, owing to the increased demand abroad. It is probable that the fear that Santos may be closed has had something to do with the advance, as well as the Transvaal War. The sales reported during the week aggregated about 102,000 bags, against 135,000 bags in the preceding week. The receipts were 75,014 bags and the shipments 119,785 bags. The foreign sales during the week are reported to have been 128,000 bags at New York, 123,000 at Havre, 67,000 at Hamburg, and 77,000 at London, a total of 395,000 bags, against 289,000 for the same period of last year and 590,000 in the preceding week." *H. & C. Mail.*

THE PLANTERS' ASSOCIATION OF CEYLON.

THE COMMITTEE.

Extracts from minutes of proceedings of a meeting of the Committee of the Planters' Association of Ceylon, held at Kandy on Monday, the 4th day of December 1899, at three o'clock (3 P.M.) in the afternoon. *Present*:—Messrs. F. G. A. Lane (Chairman, Planters' Association of Ceylon), A. Philip, Secretary, Planters' Association of Ceylon, Hon. J. N. Campbell, M.L.C., (Kandy), Messrs. Wm. Forsythe (Chairman, Kelani Valley Association), A. Melville White (Kandy), Joseph Fraser (Northern Districts Association), T. C. Huxley (Kandy), J. A. Spence (Kandy), A. J. Denison (Kandy), Edgar Turner (Maturata and Hewaheta Association), R. S. Duff Tytler (Chairman, Pussellawa Association), G. C. Bliss (Honorary Secretary, Pussellawa Association), Chas. Gibbon (Northern Districts Association), J. Anderson (Northern Districts Association), James Westland (Northern Districts Association), E. Rosling (Chairman, Dimbula Planters' Association), R Morison (Kalutara Association), C. H. Hood (Maskeliya Association), W. Saunders (Dikoya Association), J. H. Renton (Kandy), A. Cantlay, Dimbula Association), Ernest Hamilton (Chairman, Dolosbage and Yakdessa Association), A. H. Roe (Kelani Valley Association), C. E. Bonner (Udapussellawa Association), E. Webb (Kandy), L. Stuart (Dolosbage and Yakdessa Association), A. E. Wright (Kandy), J. H Sproule (Badulla Association), A. C. Kingsford (Chairman, Maturata and Hewaheta Association).

OFFICIAL ESTIMATE TEA CROP FOR 1900.

Considered the question of the official estimate of the tea crop for 1900, and intimated that to avoid delay (the matter having been overlooked at last meeting) a circular letter had been transmitted to the Honorary Secretaries of all District Associations drawing attention to the following resolution:—"(1). That an official estimate of the tea crop of Ceylon be compiled by the Planters' Association from the 1st January to 31st December, 1900. (2). That District Associations be asked to compile such estimates for their district, and furnish them to the Secretary, Planters' Association of Ceylon, by the 30th November or as soon thereafter as possible. (3). That district estimators be requested to obtain their estimates from acreages as far as possible, the statistics received to be considered confidential, and not be published by the estimators, and the total district acreages only to be given. Such returns should, in the opinion of the Committee, be: (*a*). Total acreage in tea (*b*). Acreage in bearing (*c*). Total crop. (4). That forms be issued separately to each Superintendent to be returned by him in a closed cover. That the foregoing resolutions be forwarded to the Secretaries of the various District Associations, with a request that they will kindly take immediate steps to furnish the Committee with the desired data." Resolved:—"That the action thus taken be approved, and the same hereby is confirmed. (2). That a Special Committee be appointed to consider the returns received in due course from District Associations, and to report to the Committee before 17th February (1900). (3). That the following members be asked to serve—Mr. Campbell, Mr. Huxley, Mr. W.D. Gibbon, Mr. White, Chairman and Secretary, and that the Ceylon Chamber of Commerce be invited to nominate two members of the Chamber to confer with the Special Committee of the Planters' Association, especially as regards the probable distribution of the crop."

ANALYSIS OF MANURE: DRAFT ORDINANCE FOR REGULATING THE SALE OF MANURE.

Read letter from the Secretary, Ceylon Chamber of Commerce, acknowledging roceipt of report. Resolved:—"That the Chamber be reminded of the matter and asked to expedite the perfecting of the Draft Proposed Ordinance, so that report may be made to the Committee at next meeting.

REDUCTION OF BRITISH TEA DUTY.

Resolved:—"That the discussion on the question be deferred until the General Meeting on the 5th December, 1899."

ANNUAL REPORT: NOMINATION OF SUB-COMMITTEE.

Resolved:—"That the Chairman of the District Associations, Messrs. J. R. Martin, W. D. Gibbon, A. Melville White, J. A. Spence, T. C. Huxley, J. H. Renton, E. Rosling, A. J. Denison, Hon. Mr. J. N. Campbell, the Chairman, Planters' Association of Ceylon and Secretary, Planters' Association of Ceylon with power to add to their number to form a Sub-Committee to draft the Annual Report, two to form a quorum."

THE "THIRTY COMMITTEE."

Extracts from minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on Tuesday, the 5th day of December, 1899, at half-past seven o'clock (7·30 A.M.) in the morning. *Present*:—Messrs. F. G. A. Lane (Chairman), A. Philip (Secretary), Hon. Mr. J. N. Campbell, Messrs. J. H. Renton, Joseph Fraser, James P. E. Ryan, A. E. Wright, Gordon Pyper, A. C. Kingsford, J. A. Henderson, James Westland, E. Rosling, A. Melville White, W. Forsythe, Edgar Turner, T. C. Huxley, W. Saunders, and A. J. Denison.

CEYLON TEA ON THE CONTINENT OF EUROPE.

Mr. Renton addressed the Committee on the subject.

Resolved:—"That a sum of £10,000 sterling be voted for 1900, to be expended by Mr. Renton under the heads named in his letter of November 18th, 1899, as follows:—

	£
Paris Exhibition	1,000
France	6,000
Germany	2,000
Austria	500
Holland	300
Scandinavia	300

Note by Ed., *T. of C.*—The sums mentioned total £10,100—not £10,000.]

Resolved:—"That the sanction of the Governor in Executive Council be obtained to this appropriation."

CEYLON GREEN TEAS.

Read letter and annexure from Mr. J. A. Henderson.

Discussed the question generally. Resolved in view of present information:—"That the green tea bonus be continued until the end of 1900, or until the grant of £2,000 has been expended; (2) that Mr. A. E. Wright be asked to draft a pamphlet on the manufacture of Ceylon green teas for the guidance of producers."

Read letter from the Agents and Secretaries, Upper Maskeliya Estates Company, Limited, claiming grants on 3,000 lbs., Brunswick estate green tea. Intimated that the payment had been made.

Submitted memorandum showing the appropriations under the grant as follows:—

	Lbs.		R. c.
Oct. 1898	2,010	Tillyrie Green Teas	201 00
Do.	2,137	Dehiowita "	213 70
Nov. 1898	7,800	Brunswick "	780 00
Dec. 1898	1,355	" "	135 50
Jan. 1899	6,655	" "	665 50
Do.	5,008	" "	500 80
March 1899	5,971	" "	597 10
Do.	5,145	" "	514 50
April 1899	3,080	" "	308 00

Do.	1,974	" "	197 40
Nov. 1899	3,000	" "	300 00
	90,089		9,008 90

leaving the balance of R20,991·10 still available at date.

AGRICULTURAL CHEMIST.

Submitted proofs of Mr. M. Kelway Bamber's report. Resolved:—"That 2,500 copies be printed, and one copy issued free on application to every tea estate; (II) that the printers be instruct that the pamphlet is to be protected as copyright of the 'Thir Committee' and thereafter treated as such protected publicatio (III) that the price of the pamphlet to the public be fixed late (IV) that the attention of the printers be drawn to the necessi for having the printing well and clearly executed in every w equal to the Book of Proceedings of the Planters' Association Ceylon."

CEYLON TEA IN AMERICA.

Discussed the question generally. Resolved:—"That the Cha man be empowered to inform Mr. William Mackenzie that a sum of £10,0 0 sterling will be voted for the year 1900; (II) that t sanction of the Governor in Executive Council be obtained to th appropriation."

THE ANNUAL MEETING.

Much, perhaps most, of the time occupied by the Annu Meeting this year was taken up in the discussion of matte of no great interest to Indian planters. We give the follo ing extracts from the proceedings as reported in the Colom Press:—

ABOLITION OF THE TEA DUTY.

The following resolution was moved by Mr. E. Rosling:—

That this Association considers that it is in the interest of pr ducers to join action with the Indian Tea Association in agitati for the abolition of the English import duty on tea when the tim for such agitation is deemed advisible.

He said that he would like to explain to the gentlemen who we not present at the last Committee Meeting the reason for brin ing forward a resolution regarding the British tea import duty th day. They would remember that at a meeting held last year vote was given adverse to the abolition of the import duty, a this resulted in a good deal of correspondence with the Indi Association, and finally at the last Committee Meeting of the Ass ciation a letter from that body was laid on the table which now r quired an answer. That letter was a very clear, well-reason document, worthy of their best attention. The subject-matter w of extreme importance. It was decided to take the sense of t general meeting before answering it. The letter in question h been published in the press, so that they would all have seen The question they had to consider in connection with the aboliti of the duty was how they as producers would benefit, and he wou ask them not to look upon it as a merely academic question. it were that, he considered that he should be wasting their time an unjustifiable manner, but he believed it to be the most impo ant question that had come before them since the closing of t Indian mints. He thought all of them agreed that lowering t price of any commodity to the consumer increased the consum tion of that commodity, and if any gentleman doubted that would refer him to the quotations in the Indian Association's let from John Stuart Mill & Co., and Professor Nicholson. If th increased the consumption of a commodity, and the producti remained stationary, stocks decreased and prices rose. but th had to consider what governed production. That he thoug was the common ground from which abolitionists and their op nents took diverging paths. He thought there could only one answer, and that was the amount and profit they w making. If they were making large profits, they increased p duction; if on the other hand they were making no profits all, production would fall off, and eventually became stationar He said eventually, because tea took some years to come into be ing, and so they did not immediately see the result of prices production. They practically came to this—that the abolition the duty could only affect production to the extent that it ma the industry sufficiently profitable for them to increase their p duction. They had also to consider how Ceylon fared as compar with teas grown in other countries. When the duty was reduc from 6d. to 4d. China tea continued to be used in diminishi quantities, because the British public taste was in favour of eitl Indian or Ceylon teas. Was it likely that abolition would al this taste? Was it not more likely to foster it, by bringing go Ceylon tea within the reach of those who could only afford to b the cheapest blend in which a large amount of China was m The public did not work out what percentage of duty it was pay on the lb. of Ceylon tea as compared with China; they took eit what they liked or what they could afford. He had heard it s

that the Customs Act was an Act for keeping out spurious teas. With their permission he would read what the Indian Association's letter of 17th August said:—"I am to point out that whether an article of food is taxed or not it is subject to the same laws in respect of its fitness for human consumption. Abolition would not remove any of the checks imposed as obstacles to cultivation, so far as the law went, and the question resolved itself therefore into this, as to whether or not the Customs no longer having to carefully weigh the tea would relax their vigilance, and whether, if they did, other checks in existence, or which might readily be introduced if required, would not operate sufficiently." That was not a thing on which one could do more than express an opinion. How were other food stuffs looked after, and why should tea be different to provisions, &c He might mention that the customs officers who weighed the tea for calculating the duty weighed it before it had been opened unless the weights ran very uneven. As regarded rubbishy teas that were fit for human consumption, they were allowed in now if there was any demand for them, and he maintained the demand for such teas would tend to fall off with abolition, as a good sound tea would then be brought within the reach of all. Another important point to consider was how would abolition affect the relative position of the producer to the middleman or distributor. With no duty the tea trade could be worked with less capital which must mean increased competition amongst the buyers. He had heard some gentlemen say that this increased competition amongst buyers would result in the profits of the middlemen being reduced as they could no longer afford to pay the same amount as at present. According to the gentleman who held that view, an increased number of buyers meant reduced prices to the producers, as presumably if they could reduce the number of buyers they would pay them higher prices, which of course was absurd. Did they suppose for one moment that the middleman was satisfied with his profits that day, and was paying them more than he was, or that, when in the early part of the year prices for common teas rose some 50 per cent.; he paid this increased price out of friendship to the producer, or was it that for the time being consumption out-ran production? To sum up, abolition meant increased consumption, increased consumption meant increased prices if production remained stationary, and production was governd by whether the industry was profitable or not. The Custom apparently was of no value as a safeguard to keeping out spurious teas; and finally the more competition amongst the buyers the smaller their profits, and this must go to either producer or consumer according to the ratio that production bore to the consumption. The last words of his resolution were added on the suggestion of one or two gentlemen, because there was a feeling in certain quarters—he hoped uninfluential quarters—to burk the question or rather not fan it straight in the face because the time was inopportune. Personally, he considered that the agitation had been opportune for years, and would continue to be opportune so long as the duty remained, but he was perfectly willing to leave the matter in the hands of the Joint Committees of the Ceylon and India Associations to decide as to its opportuneness. He suggested in conclusion the changing of the word opportunity to importunity. (Hear, hear and laughter.)

Mr. Westland said he had much pleasure in seconding the motion. Mr. Rosling, however, had spoken so fully on the subject that he had left nothing for him to say, further than with reference to the bonded warehouse question. He thought that the abolition of the duty would absolutely do away with the warehouse charges, and would considerably benefit them (the planters). Just now the charge for the bonding of teas were so high that they all, more or less, felt it. There had been an agitation against it, but he thought the reduction of the duty would be found far more effective in breaking down the monopoly than anything else they could do. He had very much pleasure in seconding the resolution.

AN AMENDMENT.

Mr. Melville White remarked that as Mr. Rosling had proposed an amendment to his resolution he begged to propose an amendment to Mr Rosling's motion. (Laughter.) The amendment which he proposed was really one which the Committee had adopted. Of course he did not say that as a proof of its desirability in any way. It was simply to show the consistency of the Committee and of the Association. His amendment was

"That this Association deems it undesirable to take action in the matter at present.

Mr. Rosling's motion was somewhat skilfully put together. He apparently wished to discuss and settle the academic question—whether it was in their interests to abolish the duty or whether it was not. And having settled that he went on to say, or at least to imply, that the present moment was inopportune to bring the matter before the Government at home. Well, as long as the time was inopportune—and he did not think there could be any two opinions about that—he failed to see that they could do any good in settling the academic question as to whether they would derive benefit from it or not. The amendment he asked them to carry was mainly supportable on the ground of expediency. If they went to the home Government at the present moment and asked for the abolition of the tea duty, he believed Mr. Rosling shared his opinion, and that of a good many others present, that they would be met with a blank refusal. They had war bills to meet and they must recollect that with the tea duty inevitably came the coffee and cocoa duty. He did not think any Government would abolish the tea duty and maintain the coffee and cocoa duties. If one went, the others must go. They would see, therefore, that the question was a considerable one, even to the wealth of the home Government. Another reason which he thought ought to act against their going for abolition at the present moment was the fact that the step was an absolutely irretraceable one. That was an argument which had been brought forward in Committee. He thought, when they were taking a step of that nature, they should be very cautious indeed, and at least clearer than they were then as to the benefit to be derived. (Applause.) They all knew that if they suceeded at the present time in getting the duty removed, and if it should happen that there would be no increase of consumption—he did not say there would be no increase, and had never made that assertion—there would be no advantage to them in the abolition of the duty, and it must be patent to the whole of them that by no means within their power or within the power of Indian Association would they ever get the duty re-imposed. It was an absolutely irrevocable step and one which ought to be taken with great caution. (Hear, hear.) The Indian Association had, he thought, been rather making fun of their political economy, or at least they had tried to, and the Indian and Ceylon Press had, to a certain extent, done the same They had attempted to ridicule them for supposing that a reduction in prices would not give them an increase in consumption. That Association and no member of the Association had, so far as he knew, put forward such a ridiculous statement. But the Indian Association, while they quoted to them, Professor Nicholson and various other authorities in political economy, had overlooked the one phrase which was of paramount importance in a statement of law—"other things remaining the same." As the price of any article fell, "other things remaining the same," the quantity demanded increased, and conversely as the price rose the quantity demanded decreased. Neither the Association nor any member of it, so far as he was aware, had ever attempted to controvert that statement; but to state boldly that a fall in prices meant an increase in consumption was not the fact. (Hear, hear.) If political economy was such a very simple matter as all that, it would be perfectly legitimate for them to say, "How does your law apply in the case of China tea?" The price had suddenly fallen—why had the consumption not increased? Simply because other things did not remain equal. There were such things as the development of wealth, the difference of taste, and a hundred and one other things; and because other things did not remain equal

THE PRICE OF CHINA TEA

fell, and the consumption with it. The Indian Association overlooked the fact that other things had to remain the same. The whole question was one of probabilities so far as the benefit to the producers went. They all admitted that there would probably be an increase of consumption, but they wanted a great deal more than that—they wanted to know that they would benefit thereby. If they were going to get an irrevocable step taken, he thought they required to have something much more definite than they had at present as to the result which would happen if the reduction of duty was obtained. It was not simply for them to say that, if they exported 120 millions this year to average 7d. and the cost 5d., they would make 2d. a lb. profit, and that it was equally clear that if they exported 140 millions next year at the same cost of production they could afford a loss of a farthing. They would still be as rich; they would not lose. But was there any gentleman in the room or outside who was prepared to say that the increase of 20 millions would result

only in the reduction of a farthing in the price. If it amounted to the smallest fraction more, so far from being gainers they would be losers. In the circumstances in which they were placed, it seemed to him that there were four remedies or courses open to them. One was to reduce the cost of their tea, the second was to improve the quality of their tea, the third was to exploit new markets, and the fourth was the reduction of the supply until the demand overtook it. Now, he would like to go backwards. He said that the fourth remedy—the reduction of the supply until it overtook the demand—was outside their power at present, so that they might pass it by. The third remedy, they all knew, they were carrying out as much as they could and with all the funds they could possibly raise to do it. The improvement of the quality might possibly tend to a reduction of the quantity, but at any rate it was a course open to them. They might endeavour to improve the quantity and so raise the price. The reduction of cost was a very difficult matter for them to deal with. There was very little margin for reduction, and any reduction that might now take place must, it seemed to him, take place at the London end in the Warehouse bulking and taring charges; and when he saw the Indian Association proposing to take up the question of Warehouse bulking and taring charges, and when he saw them tack on the question to which they knew they would get an unfavourable reply then he would have less confidence in them. One of the Indian papers, he believed, threw out the suggestion to Ceylon that their Committee was possibly interested in the bonded warehouses. He thought the assumption was a very gratuitous one. He did not think there was a single member who was interested in them; but they happened to know that there were members of the Indian Tea Association who were interested in them. He asked them, therefore, for these reasons, to pass over the academic question altogether, and to adopt the resolution which the Committee had at various times passed—and, he thought, sensibly passed—"that this Association deems it undesirable to take action in the matter at present. It left them a free hand to take up the academic question, or the other question, at any moment when they saw their way to do so. (Applause).

SECONDING THE AMENDMENT.

Mr. Turner had much pleasure in seconding the amendment. He had been accused of saying that a reduction of duty did not tend to increase the consumption. He had never actually said such a thing. What he maintained was that the increased consumption in 1890 could be explained away. He would call their attention to the speech which Mr. Stanton made in London. What the Custom-house authorities said at home must be of some importance. With regard to the falling off in the tea duty, Mr. Stanton said. "About 1885 a very curious circumstance was taking place, which caused some trouble to the Chancellor of the Exchequer. Though afternoon teas were, perhaps, more in vogue than they had ever been before, and tea drinking had become so general that even the medical faculty were crying out against its possible abuse, the tea duty instead of bringing a better revenue every year, suddenly became almost stationary, and continued so for some four or five years and yet less tea did not seem to be drunk." In the first letter from the Indian Tea Association they give "Statement A" and "Statement B," which were rather curious. Statement A referred to the tea drunk in New South Wales in 1892. The total amounted to 12 millions in 1892, 11 in 1893; 12 in 1894; 12 in 1895; 10 in 1886; 12 in 1897; and 12 in 1898. There was no increase, apparently, and yet they heard so much of the amount that Australia drank. In 1898 there were, approximately, 8 millions of Indian and Ceylon tea drunk in New South Wales, and 3½ millions of China. It could only be accounted for by the assumption arrived at by the Custom House authorities in a letter which he had read. Since 1890, Ceylon tea had fallen 3d. to 4d. in value in the London market. They all heard that it was over-production. As a matter of fact, the stock in hand in December, 1899, was 113 millions, about seven months' stock, and in 1898 they had but 101 millions, or about five months' stock in hand. It was due doubtless to the law of supply and demand. He feared that to take off the duty on tea would be to lower the margin of profit. (Applause.)

Mr. Campbell said it seemed to be considered an axiom that the reduction of price would increase consumption. Mr. White had argued that that would not increase the profits. Still the question was what were they going to do with the large amount of tea which they were going to put on the market in the next few years, if the prices continued to go down? They had to find a market for these teas, and the fact that the duty was taken off was acknowled to increase the consumption of tea in England. They had asked why they should vote upon the question now. He thou the time had come when they ought to make up their minds a Association. They had been sitting on the fence a long ti Surely they could make up their minds on a subject of that n and he thought Mr. Rosling's resolution put their position in a way that they could make up their minds so that their intent could be carried out at the proper time; otherwise, nobody wo know what their views were, and they would continue to sit on fence. Hitherto China tea had been displaced by Ceylon tea, cause Ceylon tea was better than China tea, and it would conti to be so even if the duty were taken off. Some people thou that China tea would get the advantage by being a cheaper t but Ceylon tea being a better tea, continued to command market in the way it had hitherto done. Mr. White referred an increase of some 20 millions, which he expected might be upon the market in the near future.

Mr. White: That was purely a supposition.

Mr. Campbell, continuing, begged Mr. White's pardon, and s "supposed" to be put upon the market. What were they goi to do with it? How were they going to get it sold if they did get some reduction of the tea duty? How were they going take it off the market? There was also the question of warehous which had been touched upon by Mr. Westland. They knew th that was a great and very important question, and that if the du were removed the warehouse charges would be done away wi It would do away with the monopoly, and have a very great effe upon the result as regarded selling Ceylon tea. He thought th ought to make up their minds to vote one way or the other, and his opinion make up their minds to vote in favour of Mr. Roslin resolution. (Applause.)

Mr. Forsythe remarked that, after what had fallen from the plan ing member, he would like to point out that he thought they shot continue to sit upon the fence. He felt certain that every gent man in the room was as prefectly convinced as Mr. Rosling th by taking the duty off tea, the price might improve, and wou vote for the duty being taken off. But the point was, were th perfectly certain of that? Supposing that price did not ris and supposing, as Mr. Turner had pointed out, that as the price a commodity fell so did the ratio of profit fall. They were in a sa position, and they could afford to sit down and wait. There w not the slightest chance, with war charges, that any duty wou be taken off. He was not, as a rule, one who sat on the fence, b he was quite willing to do so on that occasion to see how the co was going to jump. (Laughter.)

Mr. Ryan said that one point had been lost sight of, and th was that, by abolishing the duty, they could get rid of the bonde warehouse charges. Now there was no chance of their getting r of this duty, but there was a chance of their possibly getting r of the bonded warehouse charges in another way, and the way which it might be done would be by getting the duty levied by th Ceylon Government when the tea was exported for London u sworn invoices. In that way, when the tea arrived in London, would be accompanied or preceded by a draft for the amount British duty forwarded by the Treasury in Colombo. The t would then be free to be handled in any way they thought fi In that way there was a possibility that they would be able break down the monopoly of the bonded warehousemen at Hom That would be one means by which they could evade the bonde warehouse charges, even if the abolition of the duty were refuse

Mr. Rosling, in reply to the discussion, said that they wished have a definite expression of opinion as to whether they believ that the abolition of the duty was good for them or not. Un they got that, they would not have any action taken at Home o way or the other. They had had a letter from the Ceylon Assoc ation in London saying that, as they had expressed no opinion this matter, they would not take any action. Apparently, from M Forsythe's remarks, he was still going to sit on the fence. M Ryan's fiscal scheme was rather too large. He could not grasp and he thought there was very little use in bringing it before the that day. With regard to the statement that no member of th Committee ever said that reduction of prices increased consum tion, he quoted from an article bearing out his contention.

Mr. Turner said this could be explained by figures, but he d not go into them.

Mr. Rosling, continuing, remarked that Mr. Turner said that they could prove anything by figures. But he seemed to have changed his mind rather suddenly and brought them sheathes of figures from the early portion of the century. He took it that the opinion of the majority of the room that these were absolutely valueless. Mr. Turner went on to say that, although the consumption remained stationary, so many fluid gallons of tea were consumed. But they did not sell fluid gallons of tea, they sold dried tea, and he did not see any use of bringing in a side issue. He did not refer to the Bonded Warehouses, because it was a very important subject. If they swept away the duty, they swept away the monopoly of the warehouses. But in his opinion it was a side issue, though important. The abolition of the duty on tea was sufficiently strong to stand on its merits. He apologised to Mr. Westland for using the word "English;" he meant "British."

The Chairman summed up, and, on the vote being taken, the amendment was carried by 19 votes to 10.

A REMARKABLE COFFEE MOVEMENT.

The regular monthly official statement of the New York Coffee Exchange for October shows some remarkable and somewhat unexpected changes. There is a reported decrease in the world's visible supply of 336,768 bags, an increase in deliveries in October over September of 510,671 bags, and a gain of 436,219 bags over the average monthly deliveries for the first four months of the present trade year.

The following statement shows the stocks and movement for the month:—

	Bags.	Bags.
Stocks, October 1,1899—		
United States	1,190,650	
Europe	3,705,906—	4,896,556
Receipts during October—		
United States	648,141	
Europe	1,200,140—	1,848,281
Total supply ...		6,744,137
Less stocks, November 1—		
United States	1,190,628	
Europe	3,841,160—	5,031,788
Deliveries, October—		
United States	648,163	
Europe	1,064,886—	1,713,049
Deliveries, October, 1898		1,050,270
Deliveries, September, 1899 ...		1,131,838
Deliveries, August, 1899 ...		963,052
Deliveries July, 1899		822,450

In view of the remarkable gain in deliveries, we give in detail the monthly deliveries of the United States and Europe, as follows:—

	United States. Bags.	Europe. Bags.
July	433,364	636,246
August	520,966	601,318
September...	479,874	722,504
October	648,163	1,064,886

In 1898-99 the total deliveries were 13,480,904 bags; in 1897-98 they reached 14,571,902 bags, making for the two years a total of 28,052,806 bags, or a yearly average of 14,026,403 bags—equal to average monthly deliveries of 1,168,867 bags or 544,182 bags less than the October deliveries which are on the basis of yearly requirements over 20,000,000 bags.

It will be noted that the October deliveries in the United States were 170,095 bags more than the monthly average for the first three months of the trade year, or a gain of about 35½ per cent.; and in Europe, 411,530 bags more—equal to an advance of nearly 63 per cent. over the average monthly deliveries. This sudden jump is unexplainable, except on the theory that the entire trade at home and abroad have been free buyers of coffee and taken it from licensed warehouses.

Undoubtedly there has been a marked increase in consumption here and in Europe, but it is very improbable that it took a sudden leap within one month of 63 per cent. in Europe and over 35 per cent. in this country.

Many prominent in the trade claim that the rise in deliveries is due wholly to normal causes; that trade increased heavily throughout October; that the sale of roasted coffee is fast increasing in Europe, and everywhere is a tendency on the part of distributors to carry heavier stocks. They argue that coffee is very cheap; that estimates of the present crop, some six days earlier than usual, are too large, and, with rapidly increasing stocks, coffee is likely to advance. Aside from the causes given it is certain that for several months there have been large speculative purchases of coffee by outside interests, and that there is a growing faith that higher prices must rule.

During the first four months of the preceding four crop years, an average of 48½ per cent. of the total Brazil crop was marketed; and if that average holds good this year, then the total Rio and Santos crop will reach 10,696,000 bags. It is claimed, however, that conditions have placed a premium on planters hurrying forward their coffee, and that a much larger proportion of the crop than usual has come forward. In 1897-98 the receipts for the first four months were 51 per cent. of the total crop of 10,462,000 bags, and, on the assumption that a like proportion has come forward this year, the total crop will reach 10,270,000 bags.

Naturally the question arises, What are the present annual requirements of Europe and the United States? During the three years 1893-'94-'95-'96—in fact we may go back to 1891-'92—the deliveries showed little change from year to year, as the following table proves:—

	Bags.
1891-92	10,804,551
1892-93	10,946,228
1893-94	10,571,533
1894-95	11,212,851
1895-96	11,142,813
Total, five years ...	54,677,976
Average per year	10,935,595
Average three years, 1893-96	10,975,732

The five years was a period of high prices, No. 7 selling between the range of 18⅜ to 13 cents, and, with cheap teas, there was almost no gain in consumption. If the increase in population is considered, the steadiness of deliveries might be taken as an indication of the reduced use of the article. Undoubtedly the trade depression from 1893 to 1897 contributed to keep consumption from advancing, and that this view is correct finds confirmation in the gain which began with the return of prosperity and has steadily increased. The agitation about a duty led to heavy deliveries in 1897-98, but, by taking the last three years together, we get a statement that shows present requirements very fairly, as follows:—

	Bags.
1896-97	12,244,204
1897-98	14,571,902
1898-99	13,480,904
Total ...	40,297,010
Average per year	13,432,337

The above figures show a gain in consumption in three years of 22 per cent. over the preceding three years—a gain never before recorded.

The deliveries last year were about equal to the yearly average for three years, and little over 10 per cent. greater than in 1896-97—a gain that is quite in harmony with former records.

This year coffee is relatively a cheaper beverage than tea, and it is undoubted that, unusual prosperity coupled with a campaign of advertising and premiums such as the United States never witnessed before, have led to a marked increase in consumption which might rise to 20 per cent. or more over last year. During the first three months of this year, it was 16·3 per cent. above the corresponding quarter of 1898-99, when suddenly it leaped up in October to over 51 per cent. above the monthly average for the preceding three months—a gain that indicates withdrawals from warehouse far beyond consumptive requirements.

What does it mean? Has there been a sudden change in sentiment all over the world that this year's crops are inadequate to meet requirements without cutting down the visible supply to

one-third of the 7,699,788 bags held November 1, and which has led to free buying by distributors? If so, we are just seeing the commencement of an upward movement in coffee that might easily advance prices 50 to 100 per cent.

What, then, is the outlook? The year began as follows:—

	Bags.
Visible supply, July 1	6,200,000
Rio and Santos crop (estimated) ...	10,600,000
All other crops	4,300,000
Total supply, 1899-1900 ...	21,100,000
Actual deliveries, four months	5,107,321
Available supply for 8 months... ...	15,992,679
Estimated requirements balance of the year ...	11,000,000
Visible supply, July 1, 1900	4,992,679

The above estimate for the balance of the year is based on actual deliveries, November 1 to July 1 last year of 9,513,294 bags, *plus* an estimated increase of 16 per cent. in consumption. If, however, the gain is equal to that already made this year over last—amounting to 28.5 per cent. requirements will reach 12,224,000 bags, reducing the visible supply to less than 2,500,000 bags.

There is an error in the Exchange reports showing stocks in Brazil, which may make a difference in the visible supply of over 200,000 bags. Efforts are now being made to adjust this difficulty, due to the peculiar method of compiling stocks in Santos.

The sales on the Exchange in October foot up 517,750 bags—the largest business in any month for a long time. The lowest price for options was 4.15 cents for October; the highest, 5.65 cents for September. The official spot quotation of No. 7 was 5½ cents as the lowest; 6⅛ cents the highest. Present price, 6½ cents. The outlook is for a "bull" market.—*American Grocer.*

CEYLON AND THE RUSSIAN TEA MARKETS.

A meeting of local buyers for the Russian tea market was held at Colombo the other day. Mr. F. M. Mac wood presided, and the others present were Messrs. Tokmakoff, Heath, W. Kingsbury, J. H. Renton, F. G. A. Lane, W. Seale, A. A. Hankey, C. M. Wright, L. O. Leefe, W. Kenny, Cooke, H. M. Waldock, G. Alston, H. G. Rois, A. Wilson, A. H. Ayden, Geo. Thompson, G. Croll, T. C. Huxley, J. H. Adams, Lampard, Walthew, Spence, the Hon. Mr. J. N. Campbell, and Mr. Nunn.

The Chairman, having explained the object of the meeting, called upon anyone desirous of addressing the meeting to do so.

Mr. Tokmakoff in a few words thanked the Chamber of Commerce for their readiness in holding that meeting, and moved for the appointment of three or four local buyers to write to the Thirty Committee asking them to increase the sales of tea, so as to allow of local buyers obtaining more tea for the Russian market than could now be got. He testified to the increase of the consumption of Ceylon tea in Russia, and produced figures to prove this.

Mr. Heath said he had much pleasure in seconding the resolution. He had visited China and Moscow, and he could testify to the desire of the Russians for obtaining Ceylon tea. He complained of the limited quantity available in the Colombo market, and said that if there was tea available at reasonable prices a good deal of it would be bought.

Mr Walthew pointed out that at the last sales 169,000 lbs. had been bought for the Russian market.

A general discussion followed, and remarks were offered by Messrs. Renton and Lampard. The former observed that they wanted suppliers, and most of their sterling companies reserved their teas for the London market.

Mr. Lampard spoke in favor of teas being distributed generally, instead of the sale of it being centered to one particular place.

Mr Lane said he was glad to find such a large gathering present. The P. A. and Thirty Committee were much interested in the spread of tea in Russia, and he thought that Mr. Tokmakoff's resolution was a good one, as the Thirty Committee would consider what should be done. As to the kind of teas the Russians liked, it would be a good thing if planters were told what was wanted. They would be glad to have the hint. He wished to know something about the reduction of the Russian Tea duty, and asked if any of the local buyers could give him any information.

Mr. Tokmakoff said that efforts were made to get a reduction, but they had failed.

The Hon. Mr. J. N. Campbell rose to observe that last year the tea from one of his estates had all gone to the Russian market, and this year half the teas of two other estates he knew of were being sent.

The Chairman then put the motion to the meeting, and suggested that the following be appointed to draft a letter to the Thirty Committee:—Messrs. Tokmakoff, Tchokoff, Heath, Geo Thompson and G. Croll.

Mr. Thompson suggested that a copy of the letter be sent to all the sterling companies This suggestion and the motion were both agreed to, and the meeting terminated with a vote of thanks to the chair.

GINGER, AND WHERE IT IS PRODUCED.

Ginger is the root of a kind of reed, grown both in the East and West Indies and China, also largely in Malabar, and to a certain extent in nearly all tropical countries. It is also, remarks the *Merchants' Review*. New York, to be found, though of poor quality, in most of the Gulf States. The stem, or reed, is an annual, and grows directly from the root every spring to the height of about three feet, with long blades or lanceolate leaves, resembling very much in style and colour American maize or corn. This reed, or stalk, terminates in an oblong scaly spike, and from each of the scales grow a little blue and white flower. This plant is now cultivated in very great quantities in the West Indies, especially in the Island of Jamaica, from which place the finest and most esteemed is imported.

Jamaica ginger is not only cultivated to very great perfection, but the selecting, scraping, drying, and all the necessary details in its preparation are observed with the utmost care and nicety. Ginger is imported into this country either in the form of the dried roots or as a preserve in syrup, and comes from Cochin China, Africa, and the East and West Indies. The preserved ginger from the West Indies is much esteemed and commands a very high price. The ginger root grows in knotty, branched pieces, in low, fenny, or marshy soils, and has a pleasant, aromatic odour and biting taste. There are

TWO KINDS OF GINGER.

viz.: the black and the white. Black ginger consists of the inferior roots, which have been steeped in boiling water previous to being dried in the sun. The colour of the darkest kinds, however, is not black, but more of a dirty brown or stone colour. White ginger consists of the roundest and finest roots scraped clean and then dried carefully without being scalded. It is firmer, less fibrous and more pungent than the black, and, from the fact that the finest and soundest roots are always selected, white ginger is, independent of the manner of its preparation, superior to black, and always realizes a much higher price in the market; but the difference of colour depends wholly upon the manner of curing or preparing. For both of these kinds the tubes or roots are allowed to ripen, that is, they are not dug up until after the annual stalks are withered.

THE PRINCIPAL VARIETIES OF GINGER

known in commerce are, white ginger—Jamaica, Cochin China, Africa, East Indian or Bengal and Tellicherry; black or dark ginger - Jamaica and Malabar. Gingers imported into Europe are subjected to various modes of treatment, which tend greatly to improve and preserve them, for the finer its quality the more susceptible is ginger to the ravages of the fly or ginger worm. These various modes of treatment are washing, brightening and bleaching, and the gingers are consequently known in the trade as "originals," *viz.*: the ginger as imported; "washed," that which has been cleaned in water slightly acidified; "bright," the ginger

which has undergone the preparatory course of bleaching: and "bleached," that which has received a coating or dressing of lime, etc. These latter modes of treatment of ginger until recently were carried on exclusively by experts in Europe, and it is only within the past few years that the art has been introduced into this country. When a

PRESERVED GINGER

is required, the roots are taken up in the sap, the stalks not being more than a few inches long; the young roots are scalded, then washed in cold water and afterwards carefully peeled. This process lasts for several days, during which time the water is often changed. When the cleansing is complete the tubers are put into jars and covered with a weak syrup of sugar. After a day or two this weak syrup is removed and replaced by a stronger one, and this shifting is two or three times repeated, increasing the strength of the syrup each time. The preserve thus formed is one of

THE FINEST THAT IS MADE.

The removed syrups are not lost but fermented into a pleasant and agreeable beverage, known as "cool drink," used very much in tropical countries. Preserved ginger, as manufactured here and in Europe, is dark and fibrous. but when prepared in the East or West Indies or China, the West Indies especially, from the young roots, it is almost transparent. It is imported in jars, and should be of a bright yellow colour. Ginger is imported from Jamaica in barrels of about 100 lbs. each, with actual tare allowance; from Cochin China and Malabar in cases of about 200 lbs. each, also with actual tare allowance. African and East Indian ginger comes in bags of 100 lbs. each, with tare of 2 lbs. each bag.—*Canadian Grocer.*

THE "MATE" TEA COMPANY.

The history of a tea company is thus given in a Home paper :—

In examination by Mr. Bowyer, assistant official receiver, the debtor (A. E Cumberland) stated that he commenced business in 1891 as a veterinary medicine manufacturer, which, in 1893, was transferred to "The Anticuta Syndicate, Limited," which had since been wound up. He started in March 1896 in Victoria Street, as the "Mate" Tea Company. He had a capital of £1,000 borrowed from his mother. It cost a lot of money to start the business, the expenses being between £6 and £7 per week travelling. While he was travelling, the business in London was looked after by his brother and a Mr. Dastis, the agent for the "Mate" Tea. He kept a full set of books for the business, but they did not show the moneys received from his mother. The expenses exceeded the receipts by over £1,000. The £1,000 received from his mother had all gone between March and August 1896. In that month Major Coghlan agreed to purchase the business for £2,000. He advertised the business for sale in the *Times*, the advertisment setting out that the business was a monopoly, producing £20 a week, and that no previous knowledge was required. He had an agreement with the Association of Planters growing this Mate tea not to supply anybody else. That was the monopoly he advertised It was a tea noted as having no tannin in it, and did not create indigestion. Of course, he had not the monopoly for the whole of the Mate tea, as it was grown all over South America. He would swear that for the two or three weeks prior to advertising the business for sale that it was making a profit of £20 a week. Of the purchase money, £1,000 was paid in cash, and the balance was charged on the business generally Of the £1,000 he gave half to his mother and spent the balance in living and law costs. Shortly after the purchase Major Coghlan started an action against him on the ground that the profits were mis-stated, and that the profits were never made. He (Major Coghlan) took his case in the Court of Appeal, with the result that he (debtor) was ordered to repay £1,000 and costs He was too ill to attend the trial and as he could not be found to serve the proceedings upon an order for substituted service was made. He had nothing to do with the statement made at the time that he was dead. He attributed his failure to the action of Major Coghlan in shutting up the business without giving him a chance to keep it going and make it pay. Mr. Bradbury appeared for Major Coghlan, the petitioner-creditor. The examination was concluded.

DISTRICT ASSOCIATIONS.

THE INDIAN TEA ASSOCIATION (LONDON).

The following is an abstract of portions of the proceedings of a meeting of the Committee held on Tuesday, November 21, 1899 :—*Present:* Messrs. D. Cruickshank (Chair), R. Lyell, J. Riddell, F. A. Roberts, A. G. Stanton, J. N. Stuart, W. H. Verner, C. W. Wallace, and S. A. Went.

1. The proceedings of the last meeting held on Tuesday, 7th instant, were read by the Secretary, and confirmed.

2. Copies of correspondence with Calcutta, which had been previously circulated to the members of the Committee, were laid upon the table.

REGULATION OF SALES.

The following has been issued to the members of the Association by the Secretary, Mr. Ernest Tye :—

Referring to the General Meeting of importers held on July 26 last to consider this subject, I have the pleasure to inform you that definite adhesions have been received from members and others, representing over 100,000,000 lbs of Indian tea. This represents the bulk of the Indian tea imported on garden account and also a good deal of Calcutta bought tea. The scheme adopted by the General Meeting of July 26 has now been in operation since the beginning of August, and has worked most satisfactorily. I am instructed by the general committee to hand you herewith copy of the report received from the Regulating Committee, to which I am to ask your special attention. You will observe that in the opinion of the Regulating Committee the work has tended to steady the market, and my Committee unhesitatingly endorse this opinion.

The following is the report of the Regulating Committee referred to in the foregoing :—

THE TEA BROKERS' ASSOCIATION OF LONDON,
118, Dunster House,
Mincing Lane, E. C.,
October 20, 1899.

The regulating Committee beg to report as follows :—

1. That in accordance with the rules agreed to by the Indian and Ceylon Importers' Sub-Committee they were elected by the General Committee of the Tea Brokers' Association to carry out the said rules, and commenced their work on August 11.

2. That up to the present time the scheme, so far as it concerns Indian Tea, has worked satisfactorily, no opposition having been shown by importers of Indian tea to the necessary postponement of the sale of their teas, when so decided by the committee; and buyers have in many cases expressed satisfaction at a limit being placed to the quantity offered weekly.

3. That the committee regret that so few importers of Ceylon tea availed themselves of the opportunity of submitting particulars of their teas for regulation at a time when it would have been advantageous to have done so.

4. That with a view of obtaining a more satisfactory result, and one fairer to the present subscribers to the agreement, this Committee would urge upon the Indian and Ceylon Associations the desirability of doing all in their power to induce those importers to join who have not already done so.

(Signed) ARTHUR THOMPSON.
Chairman of the Committee.

MARKET REPORT.

[*Per Mail Advices of 24th November* 1899.]

COFFEE.

The London Commercial Record says :—There is little change to report. Supplies at auction have again been only moderate, and sales have generally been at firm prices to a slight advance, closing, however, quiet. East India steady, second-hand parcels being held above the market's idea. Colombian and Guatemala very full up until yesterday, when an easier tone prevailed. Dumont Santos

in request at a rise of 3s to 4s per cwt. on recent valuations. In "futures" an active tone has prevailed and larger sales have been made at higher prices owing to adverse rumours in connection with the blossoming of the Rio crop, but closing at a decline of 3d to 6d per cwt. from the highest point, *viz.*:—

London ...	Santos ...	May delivery	... 33s. 9d.
New York ...	No. 7 Rio...	,,	... 6·10 cents.
Hamburg ...	Santos ..	,,	... 34 pf.
Havre	Santos ...	,,	... 40¼ francs.
Holland ...	... Good ordinary Java	...	... 34½ cents.

At the Dutch Trading Co.'s public sale, held on Tuesday in Amsterdam, 24,252 bags Java and 515 bags Menado were offered and sold at higher prices, good ordinary Java realising 34¼c. against 31c valuation, and 29c last sale. The following are some of the particulars:—

IN AMERICA.

COFFEE.—There is a very strong market for mild sorts at the advanced quotations. Good Cucuta, in an invoice way, commands 8¾c; Padang Interior, 23¾ @ 25c. with fancy mats at 28 @ 34c. Mocha 16 @ 20c, and possibly higher for extra fine. Stocks are given below.

Brazil sorts are doing better. Deliveries are large and exceed the same time last year. No. 7 Rio held at 6¼c and No. 3 at 7⅜c. The distributive movement is highly satisfactory.

The October deliveries were exceptionally heavy, reaching 648,163 bags, against 479,874 bags in September 520,592 bags as the monthly average for the trade year, and 379,403 bags for October, 1898. In Europe the deliveries reached 1,064,886 bags, making a grand total of 1,713,049 bags, against 1,050,270 bags in 1898-99. Further details will be given in our next issue.

ARNOLD SCHRAMM ON MILD COFFEE.

"The continuance of the revolution in Colombia is apt to materially advance the prices of Bogota, Bucaramanga, and other coffees. Centrals are becoming exceedingly scarce, and all the JRB's except about 700 bags are now sold. It is also reported that the fire which occurred in "Driggs warehouse," where the bulk of the Guatemalas and very many Colombian coffees (Bogota, Bucaramanga, etc.) are stored, has resulted in smoke and water damage to a great deal of coffee stored there, which additionally will tend to enhance the value of these kinds."

TEA.

CHINA.—At auction Congous met slow competition, only a small part selling at prices favouring buyers; especially Oolong, but Green being of good quality experienced good competition, and the best sold at rather improved rates. Moning realised 5¾d to 6½d, Ningchow 6½d to 6¾d, Scented Caper 7¼d, Oolong 5⅛d to 7¼d. Green

—Gunpowder, fair to medium 7d to 8⅝d, good to finest 1s 0¾d to 1s 9¼d; Imperial 5⅜d, Foong Me 8d to 11¾d, Sow Mee 7d to 1s 6d, Young Hyson 3⅜d to 8¼d per lb.

INDIAN.—Public auctions were about on a par with those of last week, *viz.*, 51,400 packages, *versus* 51,000 packages. At this period in the previous year, 48,100 packages were brought forward. There was a falling off in the demand generally, and although good liquoring descriptions fairly held their own, ordinary and medium, particularly in Calcutta-bought invoices, were neglected. A fall of ¼d to ½d per lb. on Pekoe Souchongs and Pekoes under 7½d per lb., also ½d to 1d per lb. on Pekoes and Broken Pekoes from 8d to 1s per lb. was in many cases established. Finest and choice parcels did not evince much change, though occasionally meeting with rather less competition. The best Darjeelings were in request and commanded high figures, a consignment from the Dooterian Estate of 147 packages bringing 1s 3½d per lb.

As often occurs in November, business throughout the country is reported dull, but clearances continue to be above the usual scale, and it would seem therefore that the present lull is only a temporary one.

For 36,100 packages on Garden Account 8¼d per lb. was realised, compared with 8½d per lb. for 34,100 packages, and 8¾d per lb. for 24,700 packages in the two foregoing seasons.

CEYLON.—The quantity offered in sale was a little heavier, amounting to 25,200 packages, contrasted with 23,200 packages on the 14th instant, and 21,200 packages a year ago.

A quieter tone was apparent, the bidding being decidedly slacker and showing great irregularity, especially when quality was not equal to that of prior shipments from the same estate. Fair support from outside quarters was given to the leafy sorts of many well-known marks, and in those instances rates did not alter much. On the whole, however, quotations for common to fair grades gave way ¼d to ½d per lb., and the better kinds sometimes dropped ½d to 1d per lb., a considerable number of lots being withdrawn. Fine and finest passed very unevenly. Here and there dealers were eager to secure certain lines, and no decline was noticeable, while others received very little attention, and when sold denoted a depreciated range of value.

The average is barely 8d per lb. On the 16th instant it stood at 8¼d per lb. and 8⅜d per lb. in 1898.

JAVA.—Catalogues included 550 packages of direct import, which went off quietly, slightly in favour of buyers. Nearly 1,800 packages are advertised for the 30th instant.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

	Lbs.
From 1st to 21st Nov., 1899	14,446,190
Do. do. 1898	13,115,203

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India...	38,043	13,355	51,398
Ceylon	21,307	3,844	25,151
Java	550	—	550
Total ...	59,900	17,199	77,099

Also 1,121 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 24th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1899-1900	791,863	606,696	28,911
1898-1899	781,427	590,259	21,996

52,689 *pkgs.* INDIAN
25,750 „ CEYLON
572 „ JAVA
} Total 79,011 packages were offered in public auction this week.

The quantity of Indian and Ceylon Tea taken in foreign and Colonial markets during the first nine months of 1899 was somewhat in excess of that of the corresponding period in 1898.

	1899.	1898.	1897.	1896.	1895.
Indian ...	17,806,844	15,994,547	14,058,281	11,809,394	10,311,109
Ceylon ...	28,221,746	26,914,107	20,800,934	16,441,567	14,691,121
Total lbs.	46,028,590	42,908,654	34,859,215	28,250,961	25,002,230

The increase, although not large, is gratifying, considering the advance in the price of common Teas and the unsettled condition of the Tea market during 1899.

Export of Indian and Ceylon tea (in lbs.) to places outside the United Kingdom from 1st January to 30th September.

INDIAN.

Total lbs. ...	28,221,746	26,914,107	20,800,934	16,441,567

INDIAN.—The quantity of Indian Tea brought forward this week again shows an increase; indeed the quantity has been becoming gradually larger during each of the last three or four weeks. The result is now shown in a distinctly weaker market, bidding lacking animation, and operators showing great unwillingness to add to their stock, Teas for price also participating in the decline. The following averages are worthy of note:—"Amal T. Est. Co. Dooteria," 1/3¼; "Margarets Hope," 1/1½; "Budla Beta" and "Jokai T Co. Hattiali," 1/0¼.

Week's av. of Tea sold on Garden Account 1899, 36,675 pkgs., av. 8·19d. 1898, 34,344 pkgs., av. 8·33d.

Total Tea sold on Garden Account 1st June to date 1899, 578,269 pkgs., av. 8·58d. 1898, 550,386 pkgs., av. 8·59d.

CEYLON.—25,750 packages were brought forward, against 24,417 last week. The position mentioned above in regard to Indian Tea was reflected in the Ceylons, a fall of ¼d. per lb. being noticeable in Teas for price, while other grades passed with less competition. The quality of Teas now coming forward is, in many instances, unequal to that of a short time back. The following averages may be mentioned:—"Carolina T. Co. Goatfell," 1/2¼; "Standard T. Co. St. Leonards," 1/0½; "Nuwara Eliya T. Co. Concordia," 11¾d.; "Haputale Co. Kelliebedde," 11½d.

Avge. for week 7·85d., against 8·23d. in 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 981,551 pkgs., av. 7·98d. 1898, 1,013,711 pkgs., av. 7·75d.

Comparative Prices of Ceylon Tea in London.

	1899.	1898.	1897.	1896.
Pekoe Soug. (Ordinary leaf; fair liquor)	6¾d.	6½d.	6½d.	6¼d.
Pekoe (Ordinary leaf, little twist; fair liquor)	7¼d.	7¾d.	7½d.	7¾d.
Pekoe Soug. (Rather bold leaf; indifferent liquor)	6¼d.	5¼d.	5d.	5d.
Pekoe (Somewhat bold leaf; indifferent liquor)	6¾d.	5¾d.	5¾d.	5¾d.

JAVA.—The small auction passed off at slightly lower prices, in sympathy with other growths.

IN AUSTRALIA.

Shipments from all ports to date are 19,910,000 lbs., as against 17,873,549 lbs. at same time last year. Stocks in bond in Melbourne on the 18th instant were 2,891,652 lbs. Stocks in bond in Sydney on the 17th instant were 2,811,610 lbs. Business during the month has, on the whole, been quiet, it having been difficult to bring buyers and sellers together, owing to the discrepancy between costs and notions of value prevailing locally. Indians, however, have had fair business at gradually hardening rates, but costs are reported to be now above local parity.

IN AMERICA.

The market is geting into decidedly better shape. Deliveries are increasing and the outlook is that there will be a marked change in the situation during the coming year. The old stocks of tea which menaced the market just after the tax was put on have about disappeared. The disposition is decidedly better than it has been in many years. There will be an auction sale on the 9th instant by the Montgomery Auction and Commission Company of 12,497 packages, as follows: 1,213 packages Moyune—many attractive

chops, including seasons 1899-1900; 1,598 boxes Pingsuey—invoices of all grades, including new crop 1899-1900; 50 half-chests Japan; 146 half-chests Japan—basket-fired and sundried, handsome leaf; 25 half-chests Japan Dust; 883 half-chests and boxes Congou—new seasons and including finest first crop Panyongs; 240 packages India, Java and Ceylon Pekoe—a large variety, including all grades; 1,157 half-chests Foochow—a variety, including large, attractive lines and very handsome leaf teas; 5,793 half-chests and boxes Formosa—an unusually attractive offering, including many fancy, rich summer and autumn crop invoices; 1,392 packages Formosa—new crop, seasons 1899-1900.

COCOA.

Auctions on Tuesday offered 6,376 bags, which quantity experienced a quiet demand, only 2,450 bags selling at rather irregular rates, Caraquez Guayaquil appreciating 1s, whilst other kinds, where any change was noticeable, were easier. Of 1,609 bags Trinidad offered 550 bags sold, very fine at 78s 6d, middling to good 74s 6d to 77s, or rather in buyers' favour. Grenada very quiet, barely 90 bags selling out of the 839 bags catalogued, at 66s to 68s for good to fine and 64s for fair. 30 bags fine Demerara brought 67s 6d. Odd lots of Jamaica and Dominica sold at 63s 6d to 64s 6d. Guayaquil in good request, and of the 2,420 bags brought forward about 1,600 bags were placed at 68s for Arriba and 66s to 67s for Caraquez, the latter showing a 1s improvement. 16 bags country damaged Bahia found a buyer at 60s 6d. 70 bags Colombian, 130 bags Venezuelan, and 308 bags Haiti passed the hammer unsold. Of 330 bags African only 30 bags fine sold at 64s 6d. Ceylon very quiet, but no change in price occurred; 468 bags offered and 135 bags sold—Native, fair to good at 61s to 65s per cwt. Private business includes 100 bags Grenada at 66s to 68s; 250 bags Bahia at 64s; 100 bags Puerto Cabello, fine at 130s to 145s, fair small 77s 6d; and 600 bags Guayaquil, Caraquez at 66s 6d to 67s, and Arriba at 68s to 72s per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

	1899.	1898.	1897.	1896.
	Bags.	Bags.	Bags.	Bags.

PEPPER.

BLACK.—The market has been firm this week, with business at full rates, but the tone at the close is quiet. Singapore has been sold on the spot at 5¾d to 5 13/16d for fair, with parcels near at hand at 5 7/8d, and February-April at 6⅛d. Sales of good Tellicherry at 5 15/16d. In all about 100 tons sold.

Auctions on Wednesday offered 361 bags Singapore, 60 bags Tellicherry and 6 bags Ceylon, which retired unsold except 4 bags good heavy Ceylon which brought 5½d per lb. 389 bags chests and dust sold at 24s per cwt.

WHITE has ruled very quiet and sales have been small. On the spot sales of fair Singapore at 8 7/8d, fair Siam at 8¾d, and fair Penang at 8 7/16d to 8½d. Of Singapore, November-January shipment, about 20 tons have been sold at 8 7/8d per lb.

At public sale on the 22nd instant 280 bags Singapore were bought in at 8½d to 10d, also 81 bags Siam at 8 7/8d. 10 bags Ceylon realised 9⅛d for fine small and 8 7/8d per lb. for brownish.

GINGER.

COCHIN.—The advance in cut descriptions continues, auctions registering a further rise of 2s to 4s per cwt., but there has been no enhancement in the value of rough. Catalogues embraced 35 cases 565 bags, which modest supply was very well held; sales were only 18 cases 142 bags at 82s for bold and medium roughly cut and scraped, 50s to 50s 6d for medium—some small ditto, small cut and scraped (bags) 33s, good cuttings 19s, bright medium much small washed 27s, dull medium and small washed rough, mouldy and wormy 25s, dark and mixed shrivelled 22s per cwt. The private sales are about 700 bags mouldy and wormy washed at 25s 6d to 26s per cwt.

JAPAN is quoted at 24s per cwt.

JAMAICA.—Of 119 barrels offered only one lot sold at 64s per cwt. for good middling.

CARDAMOMS.

No fine quality was offered to-day, and where business was effected lower rates were accepted. Ceylon-Mysore sold at 3s. 3d. to 3s. 4d. per lb. for good medium pale; medium dull long, 2s. 9d. to 2s. 10d.; small pale, 1s. 10d.; long brown lean, 1s. 8d. to 1s. 9d.; splits and pickings, 1s. 8d. to 1s. 11d; Ceylon-Malabar, brown long, 1s. 10d.; Wild Ceylon, 3s. 8d. to 3s. 10; Tellicherry were held for 2s. 2d. per lb. Seeds, 2s. 1d. to 2s. 5d. according to quality.

CINCHONA.

The Chemist & Druggist says:—The bark-auctions to be held at Amsterdam on December 7 will consist of 7,127 packages weighing 606,704 kilos., divided as follows:—Ledgeriana, 451,907 kilos.; succirubra, 86,574 kilos.; hybrid, 67,728 kilos.; and Calisaya, 495 kilos. The stock in first-hands at Amsterdam on November 14 consisted of 2,429 packages Government bark, and 9,059 packages private bark, including the quantity to be offered at auction.

The shipments from Ceylon for the week ending October 31 were 17,949 lbs.; and from January 1 to October 31 they were:—

	1899.	1898.	1897.	1896.
Lbs.	552,589	764,408	611,926	1,231,359

QUININE.

QUININE.—Has been in little inquiry, and second-hand prices in consequence have receded quite ¼d. to ¾d. for December delivery since last week. On Wednesday there were sellers at 1s. 1¾d. for December delivery, and March at 1s. 2¼d.

(AVERAGE FOR ALL INDIA 8·19d.), November 24th.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first, As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," Agra Bank Buildings, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 5th proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Coorg.

POLLI BETTA, 18th December.—*Weather.*—It is cloudy, dull and chill to-day. Previously it had been bright and chill, and the East wind blowing strongly. There is a cessation of wind to-day. *Crops*—nearly all gathered; mostly under estimates. Pruning is progressing. Some estates have paid off. Others will be doing the same by the end of the month and first week in January. *Plant Diseases.*—There is still some leaf-disease present. *Labour*—has been very plentiful this season. Prices of grain continue high. *General Health.*—Good.

THE CHRISTMAS HOLIDAYS.

In consequence of the Christmas and New Year Holidays, there will be no issue of this paper on Saturday, the 30th instant. The next number will appear on the 6th January, 1900. The Editor takes this opportunity to wish readers, one and all,

A Happy Christmas

. . AND . .

A very Prosperous New Year,

with good crops, higher prices, reduced cost, enhanced Exchange in Brazil, fewer subscription lists, and an abundance of all other things good, an absence of all others unwelcome.

COFFEE AND THE PLAGUE SCARE IN BRAZIL.

Out of evil sometimes springs good, and there appears to be no doubt that coffee-planters are indebted in some measure to plague and rumours of plague for the partial recovery lately noticed in prices. The papers that reach us from Brazil are freely interspersed with references to the bubonic pest, and allusions to the plague may be said to pervade all their remarks. There seems to have been no outbreak of a dangerous character, and Santos has perhaps been the head-centre. There has, we are informed, been no hurry or panic. Nevertheless, there certainly was a scare that helped speculation if it did not disorganize trade, and the very precautions meditated with regard to the pest, must have exercised a deterrent influence on trade. The good people of Santos have been very reluctant to admit that the plague was amongst them. It was, however, merely the *name* they quarrelled with. That some frightful disease was at work in their midst, was readily admitted. Despite denials, reports spread that it was impossible for coffee to be received and shipped at Santos. There was no truth in these reports; yet, doubtless, some portion of them would be credited, and the "bulls" would take advantage of this. On 28th October last, the Rio exchange market was, according to the *Brazilian Review*, "ripe for a rise," which was only kept back by fear of eventualities. A week later the same paper remarked: "The coffee situation is looking wonderfully better than only a month or two ago, and, if Brazilian planters will only put their shoulder to the wheel and give up Paris and such luxuries, we have no doubt that they can make it pay very well indeed at prices such as are ruling at present without monopolies or any nonsense of the kind."

Natural trade conditions being favourable to a rise, rumours of plague have, so to speak, been seed cast upon fertile soil; though they have yielded profit, not plague. Again, even in distant Brazil the effect of the Transvaal War has been felt, and has exercised some effect on exchange. Helpful to the Brazilian coffee-planter this is indirectly harmful to his rival in India. These, however, are but minor matters, after all. The great factors of consumption and production are still the most potent forces in the field, and upon them will depend the future of prices. In regard to these matters we may quote a few remarks. Planters in Minas are said to be feeling the pinch more than others, and when they are invited to accept an increase of direct taxation in the form of a land-tax with a view to an ultimate reduction of the indirect export duty on coffee, they naturally enter a strong protest. They are protesting just now. Perhaps they have been somewhat pampered in the past, for the *Review* says: "What planters want in reality is not mere fair treatment but favours in the shape of loans, exemption from taxation and other privileges that they cannot get. If they would all unite and form a party to cut down expenditure, provincial and federal, they would soon see their taxes diminish; but so long as expenditure is kept up on the present scale the taxes must be paid, and, as there is nothing else to pay with but coffee, out of it it must come in some form or other, direct or indirect. The key of the situation is in this, that you cannot eat your cake and have it too."

Now as regards prospects of production. It appears that labour troubles are not so great as was asserted some little time ago. Statistics of passengers leaving the port of Santos show a decrease rather than an increase in 1899 as compared with 1896–98. The extraordinary exodus of Italian labour that we heard about not long ago cannot, therefore, be taking place. Again, crop reports dated 28th October state that receipts have been liberal for this time of the year, especially considering the enormous arrivals of the previous months. Reports from the interior are favourable, "as it has rained all over the country for some time, and we hear that a third flowering has very well taken. From some districts, like the North line, reports are spread of a very large yield for next year, whilst this year's is small. Other districts report a medium or regular crop only, but nothing decidedly bad or unfavourable has so far transpired." Advices of the 7th ultimo refer to a revival of the much-debated project of a coffee trust on a big scale, but matters have not yet assumed a definite shape. The general tenor of advices is to the effect that production on a very large scale must continue for some years at least, so that consumption must lag behind a little unless some great change occurs. There has been an apparent gain on the part of consumption of late, and many of our readers have had their hopes revived by stimulating reports of deliveries. There is a good deal to be said, however, on the side that Messrs. W. H. Crossman & Co. have taken in the letters recently published in our columns. We would recommend coffee-planters to prepare for the worst while hoping for the best, and to bear in mind that the key to success, if success is to be attained at all, is most likely to be found in Economy.

RAILWAY CARRIAGE OF TEA AND COFFEE IN THE UNITED KINGDOM.

The agitation regarding the 1-lb. draft has caused men's minds to turn to a consideration of methods of effecting economies with respect to the delivery of both tea and coffee as between estates and consumer. At a recent meeting, the Birmingham Grocers' Association resolved that a deputation be appointed to wait on the railway companies with the view of obtaining a revision of the rates for the carriage on tea and coffee. The mover said the time was ripe for them to approach the railway companies to see if they could not get some concession in the matter of the charges made for the carriage of tea and coffee. The present rates had been in existence, he believed, for about fifty years, and when they came into force no doubt they were fixed at the rate charged now, namely, 34s. for tea, which was then sold at the enormous price of 4s. to 6s. per lb. Coffee was carried at 22s. 6d. now, and this had not varied notwithstanding the great alteration in price. The risk connected with the conveyance of tea was much less than formerly, because it was sent in much more substantial packages than at the time when the rates were fixed. Besides, they must remember in this connection the low prices at which the tea could be obtained. He thought the railway companies might meet them by reducing the charges because of the enormous quantity of tea which was now sold as compared with years ago. There were many other articles on which the railway companies charged what he considered to be excessive rates. Tea was one of the chief articles which a grocer brought to the front and disposed of, and he thought they might approach the various companies and bring before them some of the arguments he had cited to show the need for some concession.

In the course of the discussion that was followed, it was

observed that years ago tea was sold at 4s. to 6s. per lb., whereas the present price was from 1s. to 2s. There was much more sold than in times past when the rates were high. One speaker remarked upon the very small risk which the companies ran in carrying tea now as compared with the time when he was a young man. There was then an immense lot of green tea sold, and it often came in flimsy packages. Now, however, tea was securely packed. The carriage on coffee from Liverpool was 1s. 1½d., and on tea 1s. 8½d. per cwt. Although the charge on tea was above that of coffee there was less risk in carrying the one than the other. It was further argued that in every chest of tea there was 33 per cent. of wood and lead, and they had to pay at the rate of 1s. 1½d. and 1s. 8½d. per cwt. for the carriage of this.

TOBACCO.

III.

OLD TIME METHODS OF CULTIVATION IN INDIA.

In the years 1800-1801 Dr. Francis Buchanan, M.D., visited Mysore, by order of the Viceroy of India, to investigate the state of Agriculture, &c. The following extracts from his report contain a good deal of information as to native methods of cultivating tobacco :—

IN MYSORE.

"In the neighbouring districts of Garuda-giri, Banawara, Gaduru, Harana-hully, Honawully, and Chin-raya-pattana, the cultivation of tobacco is very considerable. It is exported in large quantities to all the countries towards the North and West. It is sown in the dry field, cultivated for ragi and other similar grains, of which a crop must intervene between every two crops of tobacco. When the season proves very wet, it cannot be cultivated, and it requires a good ragi soil. A few small stones do not harm, but it will not grow on the hard soil called *Darray*; and, in fact, the soil of the first quality is that usually employed, though sometimes the tobacco is planted on the best fields of the second quality. In the three months following the vernal equinox, the field ought, if possible, to be ploughed ten times ; but some of these ploughings are often neglected. After the fourth or fifth time, sheep and cattle must for some nights be kept on the field for manure. During the last fifteen days of the second month after midsummer, small holes are made throughout the field. They are formed with the hand, and disposed in rows distant from each other 1½ cubit; and in every hole a young tobacco plant is set. This being the rainy season, the tobacco requires, no watering, unless during the first ten days from its having been transplanted, there should happen to be two successive fair days. In this case, on the second fair day, water must be given with a pot, on the fifteen day a little dung is put into each hole, and the field is hoed with the *Cuntay*. Every fourth or fifth day, until the tobacco is cut, this is repeated, so as to keep the soil open and well pulverised. At the end of a month and a half, the top shoots of the plants are pinched off, and every eight or ten days this is repeated ; so that six or seven leaves only are permitted to remain on each stem. In the month preceding the shortest day, it is fit for cutting. The stems are cut about four or five inches from the ground, and are then split lengthwise ; so that each portion has three or four leaves. These half stems are strung upon a line, which is passed through their root ends ; and then for twenty days they are spread out to the sun and air ; every third day they are turned, and they must be covered with mats should there happen to be rain ; but at this season that seldom comes. The tobacco is then taken into the house, put into a heap, and turned four or five times, with an interval of three days between each time. It is then fit for sale, and by the merchants is made up into bundles, which include the stems. It is sold by weight ; and on an average the farmer gets one Sultany pagoda for every four maunds, each containing 40 seers of 24 rupees weight. This is at the rate of very nearly a penny a pound, being 9s. 3½d. a cwt. In order to prepare the seedlings, a plot of ground must be dug in the month which precedes the longest day. It must be then cleared from stones, and separated by little banks into squares for watering, in the same manner as in this country is done to kitchen gardens. The tobacco seed is then mixed with dung and sown in the squares, which are smoothed with the hand, sprinkled with water, and then covered with branches of the wild date. Every third day it must be watered. On the eighth day the plants come up, and then the palm branches must be removed. If the plants be wanted soon, they ought to have more dung, and to be kept clear from weeds. With this management they are fit for transplanting in from a month to six weeks. If they are not wanted for two months, or ten weeks, the second dunging is omitted, and the growth of the plants is checked by giving them no water for eight days after they come up."

"A Wocula of ragi land plants four thousand tobacco stems, and in a good crop produces 16 maunds, worth four Sultany pagodas. This ground would sow one Colaga of ragi, and produce two Candacas, or forty-fold, worth two pagodas. The Colaga or Wocula-land, of the first quality used for tobacco, pays a tax of one pagoda ; of the second quality, it pays three-fourths of a pagoda ; of the third or worst quality, it pays half a pagoda. I measured a field said to require one and half Colaga of ragi for seed, and found it to contain 15,000 square feet. The Wocula land, therefore, should contain 100,000 square feet ; but, if a Wocula plants 4,000 tobacco stems at 1½ cubit distance, which I found to be the actual thickness, more than one-fourth of this extent cannot be allowed for it. The number of 4,000 plants, that can be put in a Wocula of land, was afterwards confirmed to me at Jamagullu. I am quite uncertain, however, whether the actual measurement, or a calculation founded on the number of plants, ought to be preferred. By the former the acre of the first quality of land would pay a little more than 3s. 6d. as land tax, and would produce 169 lbs. of dried tobacco worth 14s. 0½d. ; or it would sow almost two gallons of ragi seed, and produce almost 10 bushels worth 7s. 0¼d. On the other suposition, the rent, seed, and produce would be four times as great ; but that would render this land almost as valuable as rice ground, which cannot be the case."

Of another part of the country, Dr. Buchanan remarks that a crop of grain is always procured in the course of the year from the same ground as that on which a crop of tobacco is raised.

IN COIMBATORE DISTRICT.

Passing through the Coimbatore District, Dr Buchanan says of one locality :—

"Tobacco is cultivated not only in gardens, but also in rice-land and dry-field. In the first and last cases, the cultivator pays the usual rent. When it is cultivated on rice-land, the State gets one-half of the produce. When raised on dry field, the water must be brought in pots from the nearest well. In the month preceding the summer solstice, the field

is ploughed fourteen or fifteen times. In the month following, furrows at the distance of 2 cubits are drawn throughout the field, and are filled with water. In these, young tobacco plants from the seed-bed are placed, at 9 inches distance, and a little dung is put at their roots. The young plants are then covered with broad leaves, and for four times are watered once a day. The leaves having been removed, the plants for three times gets water once in four days ; and even again on the twentieth day, should the rainy season not have then commenced. At the end of the month the whole field is hoed, and the earth is thrown towards the plants in ridges. At the end of the second month this is repeated, and at the same time all the leaves, except from six to nine, are pinched from every plant ; and all new leaves, that afterwards shoot from the centre, are once in eight or ten days removed. When it begins to whiten, the tobacco is fit for cutting. After having been cut by the ground, the stems are allowed to lie on the field until next day, when they are spread on a dry place nine nights. On the tenth morning some grass is spread on the ground ; on this heaps of the tobacco are placed, and the roots are turned towards the circumference. The heap is covered with straw, and pressed down with a large stone. In these heaps the tobacco remains for nine days. The stems are then removed from the leaves, of which from six to ten, according to their size, are made up into a small bundle. These bundles are again placed in a heap, covered with straw, and pressed with a large stone. Every evening the heap is taken down ; and, each bundle having been squeezed with the hand to make it soft, the whole is again replaced as before. On the fifth evening the tobacco is spread out all night to receive the dew. Next day the heap is rebuilt, and this process of heaping, squeezing, and spreading out to the dew, must be in all performed three times ; the tobacco is then fit for sale. The larger leaves of this tobacco seems to me to be well cured for the European market, being not so dry as usual with that cured in India, but moist and flexible: of the flavour I am no judge. A Wocula land in a Tarkari garden produces 20 maunds of cured tobacco, worth according to the merchants, 140 fanams. According to this, an acre produces about 6 cwt. 2 qrs. 25 lbs. worth £61 15s. 8½d. The cultivators, however, only value their tobacco at 5 fanams a maund. The tobacco is cut in the first and second months after the autumnal equinox. For three successive years, three crops of tobacco may be taken from the same field : but, before a fourth crop, some other article must intervene for at least one year ; and after this plant, even in gardens, no second crop is admitted.

NOTES.

The Indian Tea Association (Calcutta). The Proceedings that we publish to-day are full of interest to South Indian Planters—coffee as well as tea men—and should be perused attentively.

Systematic Botany. Anatomists and students of development are beginning to find out, says the *Gardeners' Chronicle*, that no one set of characters is sufficient for classificatory purposes, but that all must, so far as circumstances allow, be taken into consideration.

Tempting Customers! A novel departure has been made by Alderman Duckworth, M. P., Grocer, Rochdale. To every customer in exchange for 5s worth of tea checks is given a coupon entitling the holder to a free cup of tea and plate of bread and butter at the firm's restaurant.

The Liquoring Merits of Coffee. A correspondent suggests that a topic of interest would be the liquoring qualities of the Liberica-Arabica Hybrid. Coffees are now bought more on their liquoring merits than on mere appearance ; and the point is therefore an important one.

Orange Hill Estate, Ragama. The auction sale advertised for 15th instant was not a success. Mr. Somerville, the Colombo auctioneer, announced at the beginning of the sale that no bids under Rs.65,000 would be accepted, and in the event no bid was made, so that the estate was bought in at that figure.

The London Tea Market. Cabling on the 15th instant, Messrs. Gow, Wilson and Stanton reported that competition was general and well distributed ; Fair liquoring Ceylon Pekoe Souchong was quoted 6¾d. and the average of Ceylon Tea for the week 7¾d. (⅛d.up). Of 22,000 packages Ceylons offered 19,000 were sold, while of Indians 41,000 changed hands out of 46,000 offered. The average of Indian Tea for the week was 8⅜d. (⅜d.up).

Calcutta Tea Sales. For the sale on 16th instant, 15,600 packages were catalogued. Nearly all found buyers. Quality remains about the same. There was brisk bidding throughout, except for broken pekoes which were still inclined to be a little neglected. Common and medium pekoe souchongs close about two pies dearer. Other grades and good liquoring kinds were fully firm.

Agricultural Bulletins (Madras). Vol. II. Bulletion No. 36 deals with "A Sugarcane Pest" in Madras, and is principally a resumé of reports by Dr. Bourne and Mr. Barber. Vol. II. No. 37 touches upon the Ground-nut (*Arachis hypogea*) and gives in compact form a great deal of information about this commodity. Both bulletins are from the pen of Mr. C. Benson, Deputy Director of Land Records and Agriculture, Madras.

Cocoa. On another page we give an interesting report on the analysis of some Commercial Cocoas by Mr. John Hughes, F.I.C. From this it appears that the amount of fat allowed to remain in the principal makes varies from 25 to 37 per cent., while Dr. Tibble's Vi-Cocoa is found to contain less nitrogen and more indigestible fibre, in spite of its restorative power, than ordinary cocoas. Mr. Hughes adds remarks on the fineness of granulation as well as on the solubility of cocoas ; he finds none soluble to more than 30 per cent. of the whole !

Trade on Economic Principles. A wholesale Tea and Coffee firm in England has, as a "new experiment in commerce," opened a retail stores department in order to "appeal to individuals to help us in our experiment . . . in the working out in industrial life of these principles of mutual helpfulness between all classes which modern Economists tell us make for the true wealth of the community, rather than the false prosperity of a few at

the expense of the rest." Enterprising planters will be trying next to book *the cooly* on co-operative principles, in a spirit of "mutual helpfulness."

The Tea Plant. From a note we learn that Professor Krassnow, a Russian, expressed the opinion that the tea plant must be indigenous, not only to Assam, but to the whole monsoon region of Eastern Asia, where it grows wild as far as north the islands of Southern Japan. In his book on the "Tea Producing Districts of Asia," he brings out the conclusion that the tea-plant, since the remotest times, formed two varieties, Assam and China; the first growing wild in India and the other occurring still wild in Southern Japan, where it was discovered by the aborigines after the introduction of the cultivated form from the south-west.

Colombo Tea Sales. At Colombo on the 13th instant about 11,196 pkgs. = 856,488 lbs. were offered, of which about 9,106 pkgs. = 669,958 lbs. were sold. Despite the quality of teas offered this week, showing a further falling off, prices remain firm for all grades, especially for leaf teas, which are in strong demand. There were very few good invoices offered this week, says the *Times of Ceylon*. We note, however, that 3 boxes of Bargandy silver tips were offered among the small breaks by Mr. Barber, of Messrs. Forbes & Walker, and were all bought by Mr. C. S. Antony. Of the three boxes the 1st weighing 7 lbs. was sold for R2·50 a lb. and the other two marked *A* and *B*, each weighing 4 lbs., were sold for R4·25 and R4. The total amount realised by the 3 boxes was R50·50.

Ceylon and the Paris Exhibition. The following is a list of coffee, cacao, vanilla, and cinchona exhibits received up to the 16th instant:—*Coffee.*—One bushel parchment from Cabaragalla estate, through Mr. R. Coombe; one bushel parchment from Golaba and Kelburne estates, Haputale, through Mr. A. C. Chamberlain; and one case Liberian coffee from North Matale. *Cacao.*—Two cases from the Anglo-Ceylon and General Estates Company, through the Chamber of Commerce; and one case from North Matale. *Vanilla.*—One sample from the Anglo-Ceylon and General Estates Company, through the Chamber of Commerce. *Cinchona.*—From Blair Athol estate, through Mr. F. G. A. Lane; from Ohio estate, through Mr. G. S. Anderson; and from Kanapediwatte, through Mr. G. Christie.

Tea for the Troops. The *Ceylon Observer* holds that "there is nothing gained by talking vaguely of sending tea to the troops in South Africa; *one* regiment should be selected, and surely the most fitting recipient is that one which was most recently stationed here, more especially as it has not been amongst the least serviceable right from the earliest stages of the war." The allusion is to the 1st Loyal North Lancashires. Our contemporary adds:—"Let the gift be coupled with larger ones of 50 or 100 lbs. to Mr. Rhodes and to Colonel Kekewich himself; and the same amount to Sir Geo. White—the whole being topped with a quantity of 250 or 500 lbs. for Sir Redvers Buller, the foremost of them all. Now, however, it will be necessary to add, say, 1,000 lbs. for Lord Kitchner and 2,000 lbs. for Lord Roberts, and perhaps expedient to have 5,000 lbs. in readiness for Lord Wolseley!

Brazilian Exchange. We publish to-day some very interesting remarks of the *Brazilian Review* on "Brazilian Finance," in which a good deal is said about Exchange in Brazil. In its Exchange market report, dated 31st October last, the same paper says that "it seems more likely profit is to be made out of a 'bull' than a bear deal, always bar accidents like pestilence or war that upset the best of calculations." Our contemporary persists in its opinion that "the factors of exchange are favourable and are likely to be still more so before the close of the year"; but admits, "still, the situation is delicate and liable at any moment to be upset by panic." It is stated that "dear gold (in London) is always a bear factor of Exchange in Brazil. Fluctuations of late have been sufficiently rapid: $7\frac{1}{16}$ on 23rd October, $7\frac{9}{32}$ on 24th idem and again $7\frac{1}{16}$ on 28th idem.

A new Fibre. A correspondent of the *Jornal do Commercio* of Rio draws attention to the fibre of the Guaxima, a plant of the family of "malvaceas" which grows wild everywhere, but is found in largest quantities on the low-lands near the sea. It is believed that this fibre would prove an excellent substitute for jute, which is all imported, and when cultivated prove the basis of an important industry. The threads are long and very strong and will resist the action of water; the fibre being used by fishermen on the coast for their nets, which last for years if soaked in a tincture of aroeira bark. The process of elaboration of the guaxima fibre does not require long maceration in vessels, as is the case with jute; immersion for a few days in running water being sufficient to loosen the green outer bark with the hands after which the rods should be exposed to the sun in order to dry, the woody part which then contracts and allows the fibres to be easily separated. A sample is to be sent to England to be spun and woven, and its uses and application thoroughly investigated.

Piper Nigrum in Trinidad. Some few years ago an attempt was made to grow and fruit *Piper nigrum*, which was partially successful, and ripe berries in fair quantity were produced. Many of the vines planted did not assume the fruiting stage. The Trinidad Botanical Department's Bulletin for October says:—It was observed that during the vegetation period the leaves of the vines were *cordate* in form, but that when fruiting is about to commence it may be known by the difference in the shape of the leaves, as the plant is then clothed with leaves which are decidedly *lanceolate* in form. As soon as the latter appear the flowers follow. Grown as we now grow it, the crop sets and ripens readily, and we are able to obtain yearly supplies of well ripened berries. These have been in some demand for seed purposes with European seedsmen, our vines being the most easily available, and probably the only source of supply in his hemisphere. The vines are planted at the foot of trees of *Erythrina corollodendron* which are in rows 10 feet apart and 6 feet in the row. There appears to be no special difficulty in growing regular crops, as we have had them under these conditions for the past four years. Much has been said about male and female forms of vine, but it has been observed here that when planted in a proper place and under suitable conditions, all the forms of *Piper nigrum* will seed freely. There is a form, however, which if propagated will fruit when in a diminutive state and does not climb, which produces berries at one foot from the ground.

"Mixed" Coffee. At a recent meeting of the Metropolitan Grocers' and Provision Dealers' Association, Mr. F. W. Beck, Solicitor to the Federation of Grocers' Association, delivered an address on 'New Legislation on Adulteration,' and explained the new Food and Drugs Act. In the course of a discussion that ensued he was asked if it had not been decided in the courts under Section 8, with regard to coffee and chicory mixtures, that where such mixture had been turned out in a cup, and the words had not been in the view of the customer, a person might be convicted. Mr. Beck said with regard to the notice of mixture it was quite true that in some cases there had been convictions where coffee mixture was wrapped in a screw or cup, and the notice was obscured, but a part of the section said, "The magistrate is entitled to find whether or not the mixture is intended fraudulently to increase the value," and magistrates would sometimes say it was clear that a fraud was intended, and would convict. In reply to another question, Mr. Beck said that, as long as the wrapper was properly marked, there was no need to give verbal information, but he thought it was advisable to print on coffee-mixture wrappers not only that it was a mixture of chicory and coffee, but also the words "French coffee," as it had been held in the High Court that that was a sufficient disclosure.

The United States and Brazil. A Washington report, dated October 16th says :—The firm attitude of the Administration in the matter of tariff concessions from Brazil is bearing fruit. It will probably not be necessary to impose a retaliatory duty upon coffee imported from Brazil, as was proposed if that Government continued to discriminate in favour of the millers of the Argentine Republic. Word has been received at the State Department that a report has been made by a committee of the Brazilian Congress in favour of some concessions upon the natural products of the United States and some manufactured products, which will be very satisfactory to our Government if the report is adopted by Congress and becomes a law. . . The two years allowed by that law after its passage on July 24, 1897, for the completiom of reciprocity, arrangements have already elapsed, but this is not of real moment, since the President has the power without special enactment to submit reciprocity arrangements to Congress. He is not limited by the two-year clause, moreover, in his authority to impose discriminating duties on coffee, tea, tonca beans and vanilla beans from countries which impose duties or other exactions upon the agricultural, manufactured, or other products of the United States, which, in view of the introduction of such coffee, tea and beans into the United States he may deem to be "reciprocally unequal and unreasonable." Action was taken by President Harrison under a similar provision of the McKinley law against Venezuela, Colombia and Hayti, and President McKinley was prepared to take similar action against coffee from Brazil if the Brazilian Government had shown no spirit of concession. The United States is one of the chief markets for Brazilian coffee and the imposition of a duty would have seriously injured the trade.

American Tea—Again. A report on the results of the experiment at Pinehurst has been prepared by Dr. Charles U. Shepard, special agent in charge of tea culture investigations, and will soon be issued by the United States Department of Agriculture as Report 61, entitled "The Culture: Tea Experiment in South Carolina." The report states that, from the results obtained on the Pinehurst plantation, it seems probable that the cultivation of tea can be made profitable in the warmer portions of the United States in two ways. One is by establishing a plantation on the scale of the experiment at Summerville, with capital sufficient to carry the work to a point where the product can be offered on equal terms with teas holding an established place in the markets of the United States. The other is to grow tea for home use in the farm garden. In either case tea-growing can be undertaken safely only where the temperature rarely goes below zero, and where a liberal supply of water can be depended upon. There is probably no place in the United States where the rainfall is sufficient for the best results with the tea plant, and irrigation should, where possible, be provided for in growing tea. The Summerville experiment was begun on a small scale, but the planting has been gradually increased, until now over fifty acres are planted in tea. When the plants arrive at full bearing, the yield should be at least 10,000 pounds. The problem of providing labour for plucking tea leaf has been solved, so far as a steady and skilful band of nimble-fingered children goes ; but its cost is inordinately high, as compared with the Orient. It was indispensable to secure a reliable corps of pickers. To meet this condition a comfortable schoolhouse was built and a competent teacher engaged. The colored families of the neighbourhood were then invited to send their children to the school free of charge. They would be taught the ordinary branches, and would also be taught to pick tea, and so earn money to buy food and clothing. The offer was accepted, and now there is a good list of pupils to draw from.

LETTERS TO THE EDITOR.

ERYTHRINA LITHOSPERMA.

DEAR SIR,—I enclose letter from Mr. Oliver of Mysore *re* growths of *E. Lithosperma*, as he authorises me to do so. You will probably be interested in his remarks, as *Planting Opinion* will always be honourably associated in the introduction of a shade tree, that is certain to do away in future with expenditure on nitrogen. This alone would mean a vast saving to the coffee industry. I think you are wrong in assuming in your issue that mineral manures will be found necessary for *E. Lithosperma*. It is a forest tree and there is no *crop removal*, as is the case with leguminous crops, which need mineral manures to compensate for crop removal. Kindly return Mr. Oliver's letter when you have done with it.

B. NELSON.

P.S.—Mr. Oliver's experience of *Erythina Indica* agrees with mine, and his remarks about *Albizzia Moluccana* go to show that there is great difference in the value of leguminous shade.

B. N.

(INCLOSURE.)

DEAR SIR,—Just a line about the *E. Lithosperma* grown from your seeds. The first plants that were planted out here were planted in 1897 in a clearing planted in 1896. I measured one of these trees about 10 days ago and it measured 2 ft. 5½ ins. in circumference, a foot from the ground. I planted thousands of *E. L's* in 1898 and left for Home in May last, returning at the beginning of this month, and was

quite astonished to find what were open patches, a jungle of *E. L's* and the coffee looking very well under them, and, as far as I can judge, so far I think *E. L.* the very best tree for temporary shade that I have ever come across. As to its manurial properties, I cannot speak, as I haven't had the trees long enough, but I hope to make a three or four acres clearing with nothing but *E. L's* as shade trees by way of an experiment.

I planted thousands of *Albizzia Moluccanas*, thinking that they would make an ideal shade, but the sambur grazed on them and hammered them to pieces, killing most of them. The survivors, however, throve amazingly, but I have now found that coffee dwindles and becomes beautifully less under them, and I think them one of the most inimical shade trees, although beauties to look at. I am getting rid of the survivors and have to thank the sambur for their work. I trust that the *E. L.* may not turn out like the *A. M.* as it grows older, but it does not look like it at present.

I shall not require any more seed as my 1897 trees are seeding, but I thought it might interest you to know how these had done here and you are quite at liberty to publish this letter in *Planting Opinion* if you like. I tried some *E. I's*, but they don't grow like *E. L's* here ; there is no comparison between the two. Have you had any other planter's experiences of *E. L's?* Most of mine are planted at an elevation of from 3,400 to 3,900 feet.

G. R. Oliver.

THE FUTURE OF COFFEE.

No. III.

I promised last week to try and show how Indian coffee planters might increase their profits by taking a lesson from their Sao Paolo rivals. We shall benefit as much by reducing the cost of our production, as by an increase in its price ; and I cannot resist once more drawing attention to the fact that what we want *at present* is **not** an increase in the gold value of coffee. The only thing that will really check over-production in Brazil is the rehabilitation of the milreis ; which would mean, to the Brazilian planter, a further fall in the price of his coffee. Only let the milreis go up to a shilling, or a little higher, and Brazil production will receive such a check that the gold price of coffee will very soon rise. That the milreis is bound to go up, as I said in my last, I myself firmly believe ; and this conviction is gaining ground, as may be seen from the well chosen quotations in the *Planting Opinion* of the 9th instant :—First from the Brazilian Minister of Finance, who thinks that the milreis will rise to 15d., as soon as the volume of the currency is reduced to 390 or 400 thousand contos and secondly from the writer of the article in the *Moniteur des Interêts Materiels*, where the figures given seem to prove that Brazil "independently of the effect that the withdrawal of paper money. .. . . . may produce, has entered upon the period of rising exchange. As regards the effect of the withdrawal of paper money, this can only be very gradual, in view of the comparative insignificance of the notes destroyed." Without going into their arguments the fact remains that here are two men of very different opinions, coming to the same conclusion, *viz.*, that the value of the milreis is bound to rise, though they arrive at it by very different routes.

To return, however, to the Brazilian coffee planter, Monsieur Conty tells us that the average yield—generally—is 3·3 lbs. per tree, or about 1½ tons per 1,000 trees, and that this yield is maintained, in most cases, and for many years, without any manure, save the skins and husks of the coffee, which is prepared for market on the estates. There is also, though he does not allude to it, the green manure resulting from the roots, stalk sand leaves of the shrubs and cereals grown between the rows of coffee, to which I shall presently refer. He mentions one planter (manager ?) who has more than two million trees. Estates seem to be, generally, larger in Sao Paolo than is usual in India ; and, when it is remembered that the trees are planted from 12 to 16 feet apart each way (from 170 to 302 to the acre), the size of this property may be imagined. At 200 trees per acre two million trees would cover 10,000 acres, or more than 15 square miles. On this huge property the *average yield* of trees from 6 to 16 years old is said to be 5,000 lbs. of cleaned coffee per 1,000 trees (!) ; from 16 to 20 years old it is 3,300 lbs. per 1,000 trees ; and from 20 to 90 (!) years old it varies from 1,650 to 2,540 lbs. per 1,000 trees.

The trees, as I have said, are placed from 12 to 16 feet apart ; and, as soon as they are planted, they are handed over to European labourers, principally Italians, though comprising a few German and Portuguese, who take a contract to maintain them for four years. They are paid from 60 to 150 milreis per 1,000 trees per annum, the salary increasing as they go inland and farther from the town of Sao Paolo. Each man or family is also provided with a cottage, surrounded by a plot of land, on which they are encouraged to raise poultry, pigs, &c., and they are allowed to grow beans, &c., between the rows of coffee, *and to take whatever crop they can get from the coffee itself, till it is fully four years old.*

A single man looks after about 3,000 trees (12 or 15 acres); and, if he has a wife to help him, about 5,000 : and Monsieur Conty says he saw several men, who had large families, who looked after 15,000 trees, or from 50 to 75 acres ! From this it is clear that, besides the value of the secondary produce, and whatever crop he can get from the coffee till it is four years old, a single man gets 37½ milreis per month as pay ; and a family man who can look after 15,000 trees, 187½ milreis per month. As monsieur Conty says that the labourers who take these contracts are usually experienced men, who understand the business, and who have managed to save something out of their previous earnings (and often employ day-labourers to assist them), it is probable that they are able to live almost entirely on the value of the secondary produce, and to save nearly all of their pay. For it must be remembered that, although the milreis is at present greatly depreciated with reference to gold, the intrinsic value of the silver milreis is something greater than that of the rupee. The purchasing power—locally—even of the paper milreis, must be about the same as it was when it was worth 20d. in gold ; otherwise, local wages must have risen enormously (some 250%) ; but this is not the case.

Now here are two things which the Indian coffee-planter might, I think, with great advantage, copy from his Brazilian rival. The first is to plant his trees from 12 to 16 feet apart (and, where they are already planted, to cut some of them out), so that he may grow beans or other leguminous plants in between, in hopes of getting, as they do at Sao Paolo, 5½ cwts. per acre (3 to 5 lbs. of clean coffee per tree) without using manure, or at least without using nitrogen ; and the second is by giving the coolies the secondary produce (and the crop till the coffee is four years old ?), in order to secure their hearty co-operation and to give them an interest in working it to the

best advantage. It would certainly be difficult, at first, to find men amongst the coolies who would appreciate and justify such liberal treatment, but no doubt some few might be found; and, a beginning once made, all difficulty in continuing it would disappear. Monsieur Conty does not give a very detailed estimate of the working expenses of an estate, when once it comes into bearing; but he states it roughly as follows, taking the arroba (33 lbs.) of clean coffee as the unit.

	Milreis.
Cost of cultivation per arroba of clean coffee ...	2·000
Do. picking " " ...	1·600
Do. pulping and curing " " ...	·800
Do. transport to coast, including brokers' commission and export duty	2·000
Octroi dues	·060
Total cost of producing and putting on the market 33 lbs. of clean coffee	6·460

As for manure, he scarcely mentions it. He says, in one place, that they do employ it, but apparently most of them use nothing but the refuse (skins, husks, &c.,) remaining when the coffee is pulped and cleaned: and he states that one particularly go-ahead planter (an Engineer by profession and educated in France) has procured a chemical mixture from Europe, composed principally of phosphate of lime (superphosphate ?), and that the Government of the State of Rio de Janeiro, imported something of the same sort, which it sold to planters at cost price. But though superphosphate would no doubt be useful, and even a little potash on worn-out soils, it is clear that, by planting beans, &c., between the rows of coffee, they are able—at least in Brazil—to do pretty well without it.

There is a leguminous shrub very common in South India, called in Tamil *Thuggera poondoo*. It grows to nearly the size of a coffee tree. For certain reasons I fancied that it contained a good deal of potash; so—fourteen or fifteen years ago—I sent samples of the ashes of this plant and of ferns to be analysed in England. The result was as follows:—

Potash and Soda.

Fern ashes ... ... 20·76 per cent.
Thuggera poondoo ashes ... 19·97 " (besides magnesia, 6·75%), phosphoric acid, 4·90, and lime, 22·26 per cent.

As this plant is a true collector of atmospheric nitrogen (its roots being covered with nodules), and as it is also rich in potash, it would be a most valuable shrub to place between the rows of coffee, the only objection to it being that it is useless as a catch crop, the pea or seed which it yields being of no economic value.

But my letter has grown too long, so I must, rather abruptly, now bring it to a close.

COFFEE-PLANTER.

PEPPER: BLACK AND WHITE.

A correspondent, signing himself "Diogenes." goes out of his way, in the number of *Planting Opinion* for July 22, to make an attack on a paper published by me in the *Agricultural Journal of Queensland*, in which I very briefly touched upon the subject of the popular belief that black and white peppers are the products of different plants, and pointed out, necessarily briefly, that they are produced from the same plant.

When in 1887 I had the pleasure to visit your city of Madras, inquiring, amongst other things, into the culture and manufacture of pepper, I had such a favourable experience of the hospitality of the Madras people that I have every confidence in asking you, as a matter of ordinary fairplay, to insert the few remarks I have to offer on that production of "Diogenes."

In the first place, it will occur to you that this article which your correspondent endeavours to ridicule was published in a Queensland journal, and that your correspondent writes also from that country. The Queensland Press, in common with that of the rest of the world, is only too glad to give all facilities for a free discussion upon all topics of public or scientific interest, and it is only here on the spot that the true value of your correspondent's remarks about "departmental wiseacres," "longwinded screeds," &c., can be accurately estimated. But Queensland editors have a habit of asking questions, and the questions they would probably ask are, Who is Diogenes? What has he done to entitle his views to credit on this subject? Is his experience of the growth and manufacture of tropical products such as was exemplified in the career of the ill-fated Queensland Coffee Company?

It is highly probable that the answers to these questions would have very largely discounted the notice taken of the strictures of "Diogenes," and of the information supplied by him relative to his "discoveries" of species of the genus *Piper* in the scrubs of Queensland.

This kind of "discoveries" is very familiar to us. The person who is constantly discovering things well-known for generations, is the cause of a great waste of time, and can hardly complain if he is not always taken seriously, and does not meet with that prompt recognition of his valuable "discoveries" which he considers his due, and which your correspondent complains was not extended to him. "Diogenes" goes on to say that I know nothing of the existence of the wild peppers of our scrubs. Oh, yes! I have known them for a long time. My friend, the late Dr. Bancroft, of Brisbane, used *Piper Novæ-Hollandiæ* as a drug in the treatment of mucous discharges nearly twenty years ago. He describes it as "having a warm aromatic taste, rather pleasant and a benumbing effect on the tongue when applied in minute quantity."

This, and the other species of *Piper*, referred to by your correspondent were fully described by Mr. F. M. Baily in his *Synopsis of the Queensland Flora*, published in 1883. The economic features of these plants have been ably discussed, by Mr. Maiden of the Sydney Botanic Gardens, in his "*Useful Plants of Australia*," published in 1889. There are, as you doubtless know, about six hundred species of *Piper* known to botanists, but of course it is a great mistake to suppose, as is often done by imperfectly informed people, that because a plant bears a certain generic name, it must necessarily possess the properties of some other member of the same genus.

The *Pipers* of our scrubs are, in two instances, very tall climbers, flowering away on the tops of very high trees. The stem of one *Piper Novæ Hollandiæ*, is frequently three feet in girth, and has been exhibited at the Colonial and Indian Exhibition as a timber. None of them can compare for a moment, from an economic point of view, with *Piper Nigrum*. At a pinch the fruits might serve as a substitute, but would hardly pay to gather, to say nothing of cultivating.

Your correspondent complains of my "longwinded screed" about the antiquity of pepper, and its exaction from the Romans as a war tribute. This reference will be found in the *Encyclopædia Britannica, Vol. XVIII*, an authority not much given to "longwinded screeds." It is also mentioned

in that classic, *Watt's Dictionary of the Economic Plants of India*, and by the well-known authority, Dr. Dymock in a paper on *The Narcotics and Spices of India*, read before the Anthropological Society, Bombay, in 1889.

With regard to your correspondent's criticism which you print in italics, "Fancy, making white pepper out of black by simply letting it ripen before it is picked!" Of course no one fancied anything of the sort. The brief reference I made (fourteen words) was intended to show that the two kinds were made from the same plant, and not as an exposition of pepper curing, the papers being intended as a popular account of the plants in our Gardens, to evoke public interest in them and promote a more general desire to study their properties. White pepper has been made in London in considerable quantity from the black as imported from the East, by simply removing the outer coat by machinery. As I pointed out, the methods differ in different places, and the methods of "sweating," &c., are not capable of being conducted according to hard and fast lines, but like all such processes, must be regulated by local needs, experience, and limitations; but in all cases of which I have any knowledge, white pepper is made from the ripe, and black pepper from the less advanced, fruit. Surely, either yourself or one of your planter neighbours can settle this in a moment. *The Encyclopædia Britannica* says "white pepper is obtained from the same plant as the black, and differs only in being prepared from the ripe fruits." *Spon's Encyclopædia says*:—"White pepper.—This is produced by the same plant as black and is prepared by allowing the berries to ripen," and then goes on to describe one of the processes used in sweating the ripe berries. *Simmond's Products of the Vegetable Kingdom* states—"that the berry is allowed to ripen, and when gathered, immersed in boiling water, and subjected to friction." In *Simmond's Tropical Agriculture* we read, "The finest berries, in the second stage towards maturity, are selected for making white pepper." *The Weekly Drug News*, speaking of the Straits Settlements, says,—"black and white pepper grow on the same vine; the green pepper-berries, just before maturity, after gathering, turn black and make black pepper, while white pepper is obtained by gathering the berries (fire-red in colour) when fully ripe, and through long soaking in water and subsequent stirring and shaking, relieving the berries of the outer skin; after which on being dried they become 'white.'" Mr. Dobree, whose utterances on tropical products I prefer to those of your anonymous correspondent, in writing of the methods employed by the Chinese in Singapore, says—"white pepper is made from the best and ripest berries."

I may say that in 1888, I visited Singapore, and under the scientific guidance of my friend Mr. Fox, then of the Botanic Gardens there, and now of the Botanic Gardens of Pinang, I had an opportunity of noting several ways of decorticating pepper there. In a capital article which appeared at that time by a local planter in the *Singapore Free Press*, the writer says—"white pepper is made by fermenting, or more properly speaking, soaking for several days, the berries that have turned or are on the point of turning, red."

Consul A. G. Struder, of Singapore, in a Consular Report to the Imperial Government, writes "as I have been reporting on white pepper, I would briefly say that it is produced from fully ripe berries (light crimson in colour, and in size about the same as an average currant) from the same vine that yields black pepper, the latter being plucked green, before maturity."

It may be mentioned, in passing, that *Piper betel* is the plant which bears the betel-leaf or pán of India, and not *Piper "fragrans,"* as stated by your correspondent. It is not quite clear that your correspondent has the correct names of the discoveries he has made and communicated to you, because, when they were sent to the Colonial Botanist, the specimens were so meagre, and so badly prepared, that, although these *Pipers* are quite common, it was not possible to give the names with any great certainty, and your correspondent was so informed by letter at the time.

If you chose to give to the world, through the medium of your journal, these "discoveries" of plants long ago described in every flora of Australia, that is of course your own business, and no one has a right to complain. But I have a higher opinion of journalism generally, and of your paper in particular, than to think that you would willingly open your columns to ill-digested ridicule of any earnest work, and that from a correspondent who carefully conceals his identity, obviously writes under a strong sense of disappointment at the neglect shown to his transcendent abilities, and whose scorn of official sources of information is attributable to the feeling which prompted the fox to regard the grapes with such serene contempt.

Brisbane, *11th November 1899.* Philip MacMahon.

[Note.—We have to express our regret that personal remarks, such as those alluded to, should have been allowed to appear. Until their offensive character was brought to notice by Mr. MacMahon, however, we had not connected the animadversions of "Diogenes" with any particular individual. Had he attacked some one nearer Madras, we should no doubt have been more on the alert.—Ed., *P. O.*]

NITROGEN HUNGER AND COFFEE DISEASE.

It is with some hesitation and some apologies, being no other than a very interested observer and that during the last six years, that I wish to state reasons for saying that there seems every fact existing for stating that the coffee plant in East India to-day is living under one almost continual struggle for its principal food, nitrogen, producing a very high loss indeed of such important bodies as the hydrocarbons and albumenoids throughout the entire *active* system of the plant; this loss of these bodies casting it into an entirely weakened or enervated state, thereby giving a fitting soil for the germs of disease to effect an entrance and complete the further ruin of the plant on those very same bodies whose original paucity first gave invitation and allowed ingress to the disease. In no way is it wished to take no, or little notice even of the mineral matters; their also great value is recognised as affording a hardening and therefore protective value to the attacks of the disease germs on the leaf should the germs alight upon the leaf. Necessarily, the correct *balance* between the organic and mineral constituents of a system has to be maintained, and one cannot neglect either one, to suffer *too big* a deficiency, or the system may become weakened. No one would refute this. Nevertheless, you cannot but recognise, it is thought, the almost overwhelming value of the very large volume of fluid bodies, the

hydrocarbons and the albumenoids existing in the plant, since these, it will not be gainsaid, are the very *energy and strength* givers of either the animal or vegetable world, and if one may not quite legitimately call them the "fuels" of the system, as in the animal world, you certainly may call them, essentially the energy and strength givers. To deprive a system of those would leave the system in extreme weakness, or predisposition to disease. It is precisely these "fuels," so to speak, that it is believed it is possible to show are very highly deficient indeed in the sap and soluble tissue—in the blood of the tree, where the whole of the life and energy is centered therefore—not in the insoluble parts or framework, as it were, but in that portion of the tree where the real life is. I do not wish to delay on this but merely to say that those materials of such importance to plant life can be traced up as not being capable of formation within the plant on account of a non-sufficiency of *assimilable* nitrogen at the roots and a great non-continuity of this at certain times of the year and causing at those times a great lack of those essentials for plant life and imperilling the plant in these carbon bodies. At least, it is thought that these matters can be traced; and I will ask the indulgence of your readers to see if one may not prove these matters to the hilt. It is wished to lay especial stress on *assimilable nitrogen*, apart from simply nitrogen, on, that is, nitric acid, the digestible form of this constituent arising from decay of organic matter, whether it be of soil or of manure—for it is clear the digestible nitrogen is the only form one can take cognisance of and one has to enquire therefore the *rate of formation* of this and the *powers of retention* of the same in the soil. Both of which powers it is wished to show are seriously deficient when one is producing one of the most nitrogenous crops extant and under the difficulties a surface feeder experiences in a tropical climate.

If any claim exists for my writing on the subject of *Hemeleia vastatrix*, the fungus attacking the leaves of the coffee plant, it is that not only have I conferred with many authorities during several years on matters relative to this disease but direct help has been held out to me in investigating the cause and cure of disease by such authorities still further, and there seem to me now such interesting investigations on foot that *may* throw much light on the original cause of the outbreak in East India that it is scarcely thought it would not be of interest to your readers. Moreover having spent some five or six years in certain chemical manure works, allows one an extra chance of viewing the theoretical side of the question with a little more competency than would otherwise be the case. While, on the practical side, I have spent very continuously indeed every endeavour to watch the plant carefully in many various districts, under rainfalls of extreme variety and carefully noted the different behaviour of the plant on different soils or under the various manures, asking the why or wherefore of certain things.

These are my excuses, and perhaps if several authorities had not at various times offered me assistance, the subject would not be ventured on by me. I leave the whole thing open to criticism and if it cannot be shown in every way that leaf-disease *is not* a concomitant evil of nitrogen-hunger, then I take the criticisms it deserves; but I am certain it can be proved, with nothing missing theoretical or practical to accomplish it.

A part of the subject of far more interest to me, however, is the question of whether the coffee plant has not the powers of acting like the order of Leguminosiæ and some four or five other plants outside this order, in the capabilities of taking its nitrogen diet. There seems much indeed to show that this very variable plant has, on favourable conditions existing, the extremely useful powers of feeding off both atmospheric nitrogen in the pores of the soil—or off nitric nitrogen—or off both at the same time, such powers being held by not only the Leguminosiæ, but such as *Alnus*, *Elæagnus angustifolius*, *Hippophäe* and *Podocarpus*, all of which are able to thrive in soils destitute of nitrogen. See "Technical Mycology," Dr. Lafar, 1898. The subject is in its infancy, *quite*, and, contrary to my critics in the *Madras Mail* who wished to show that there was nothing for resting this belief upon, I wish to show that there is everything nearly demanding that this vegetation has these powers, and moreover that it was the sudden failure of the excrescences on the roots or their bacterial contents, which threw the plant as dependent, or nearly entirely dependent, on the nitric of the soil or of manure.

Scarcely could any plant be more capable of changing its character under changes of environment than the coffee tree, perhaps. There is no constancy in the composition of the coffee bean, either in total mineral matters, in proportion of one mineral constituent to another, or, if one comes to the organic materials, there is in them, if possible, more variability than in the mineral or ash constituents. There would be nothing contrary to reason for believing that this plant *has* that exceedingly useful power of obtaining most of its nitrogen diet from the atmospheric nitrogen in the pores of the soil. On the contrary much seems to prove that such powers *can exist* in the plant, and that these fungi on the roots, after a lapse of living in uncongenial soils for years, can fail, driving the plant to a dependence on that at all times very frail and fugitive source of nitrogen—nitric acid. Nor can it be doubted that the application of artificial manures, especially such perhaps as superphosphate, nitrates, sulphate of ammonia, would help the soils to hasten the failure and extinction of the root fungi and drive the tree to a sole dependence, or nearly sole dependence, on that fugitive source of nitrogen—nitric acid, by, I mean, the showers of concentrated acids more or less, which would pour upon the fungi, or their bacterial contents, and which once the unhealthiness of these was once started, and once therefore the source of atmospheric nitrogen began to fail thereby, there would naturally arise thereby a certain necessity of the more constant and continued applications of manures rapidly yielding nitric acid for the plant, again in its turn injuring the root fungi and again in the further failure of these calling for more nitrogenous manure, in time therefore becoming, perhaps, entirely a depender on soil or manure nitrogen, *i.e.*, nitric acid. This is entirely in accord with the well known ways of Leguminous and the other plants before mentioned, and it is obvious to anyone who will consider for a moment how distasteful and finally disastrous would be the slow and steady flow of various acids on the root fungi arising from the decay of a forest soil's organic matter or again from the far more concentrated acids arising from the decay of artificial manures. I may be entering a little too much into detail here on a portion of this subject which necessarily should come after first proving the first point, *i.e.*, the depend-

ence of leaf-disease on a state of nitrogen-hunger at the roots; nevertheless it is interesting to notice that coffee after existing and healthily flourishing in Ceylon for a hundred or more years in Ceylon, fed practically by no manures whatever, producing those yearly crops of 5 cwts, 7 cwts. and 10 cwts. per acre, was in the year 1863 beginning to be treated with certain amounts of artificial manures. In the year 1860 the importation of manure to the Island of Ceylon was valued at £4,050; in 1863 it rose to a value of £20,280; in 1870 £73,866. This latter date was just about the date of the first outbreak of disease. It is strange, if it is not significant, that coffee healthily flourishing in the Island for, perhaps, a century or more should be attacked by disease at a date so very nearly coincident with the introduction of artificials. Neither would one anticipate the quite immediate extinction or unhealthiness of these bacteria in the excrescences by manures giving strong acidity by their decay, but after a short series of years their reverse of beneficial result on the bacteria would be felt, and one would not be surprised at their suppression by the evil effects on them of strong acid-giving manures, especially when you come to forest soils weak in alkalies and further again in dealing with a surface feeder. I may have laid too much stress on the coincidence of leaf-disease appearing so soon comparatively after the introduction of artificials, and, though not wishing to touch upon matters of soil here, *it is to this*, more than to artificials, it is wished to attribute the perhaps gradual declining strength and health of the proposed bacillus in the excrescences, and that the climax was reached only after the introduction of artificials. The bacillus radiciola, the bacillus inhabitating excrescences or nodules, is a lover of oxygen existing as much in the atmosphere above as in the pores of the soil. Anything therefore retarding the oxygen, or the presence of acid traces or the absence of a sufficiency of lime carbonate, all of which I am certain may be very distinctly visible in these forest soils, then one does not obtain the suitable and congenial home for this useful species of bacillus, the bacillus requiring certain features in the soil for its health.

I may be placing the cart before the horse in so entering into detail. It should first of all be shown the reasons for stating that coffee to-day *is* existing under this state of nitrogen starvation. As before stated, this, I believe, may be traced up to the hilt, in every way possible, and that disease is merely a resident on the plant when there is any abnormal state of nitrogen starvation at the roots causing in the channels, ducts or arteries of the tree, an enormous loss of those soluble fluid bodies the hydrocarbons and albumenoids which nitrogen has the all-powerful means of controlling their presence or absence.

It is certain that to-day coffee is a feeder principally, if not entirely, upon nitric acid. With us—the way most plants take their nitrogen—this is known by the immediate taking on of certain characteristics by the plant on giving nitrogenous manure and which are unmistakable. Let me, however, urge the extremest difficulty which would exist for a surface feeder—producing one of the most highly nitrogenous crops extant outside the order of Leguminosiæ—subject to tropical and incessant deluges often amounting to 100 and 150 inches in three months—growing not in soils active or in soils accustomed to many years of tillage but in *heavy, forest soils*, weak in alkalies and oxygen, where therefore exists, not only two impedimenta for the necessary quick formation of assimilable nitrogen but the pretty well assurance that this nitrate or nitric acid formation stops after a certain point is reached and at an early date. Take this slow action of forest soils in this producing assimilable nitrogen, the surface feeding nature of the roots, the highly nitrogenous nature of the crop grown, the incessant tropical deluges rapidly denuding the soil of its nitric acid (2 inches rain being sometimes sufficient to take nearly the whole of the nitric acid below the roots) and ask oneself the question, how, in such incessant rains of day and night and weeks, is it possible to expect coffee to find assimilable nitrogen, and therefore to find it capable of producing that large volume of organic bodies throughout its system? Again, one has to take into consideration the very limited sphere of action for the roots, that is, the small amount of food presented to it, and still again the small size of the tree in proportion to the amount of crop, it being clear that all such matters must be taken into consideration if one is to show insufficient feeding in nitrogen and a severe loss of soluble carbon bodies in consequence. Again, in consequence of that loss of these strength and energy givers—the attacks of *Hemeleia vastatrix*, causing a still further loss of those important sap constituents.

It seems to me far too difficult to believe, and I think will be so to any fair unbiassed person who will at all consider the subject that coffee ever fed purely on a nitrogen diet arising from the nitric acid of soil or of manure—there is everything against this crop doing so under conditions it experiences in a climate subject to tropical rains and tropical droughts and I must repeat what was said in the *Madras Mail* that "under favourable conditions existing, one may not only prevent the occurrence of leaf-disease but cure it even, if taken in quite its early stages, by nitric acid treatment alone" It is the severity of the factors in tropical rains, in droughts, insufficient care in even spreading of this constituent over the roots, high amounts of organic matter in soils, too late an application in the same, etc., which often mar the results—it is not the fault of nitrogen but the factors against this nitrogenous feeder which must exist as long as it feeds off nitric acid for its source of nitrogen. I do not wish to be dogmatic but will remain firm to that point, that under favourable conditions the prevention and even cure of leaf-disease may be met by permitting the constant flow of these viscid, adhesive fluid bodies throughout the plant to continue uninterrupted—the sugars, gums, starches, and viscid nitrogen bodies must not be allowed to be lowered; otherwise you obtain, and very naturally, the entirely weakened, enfeebled state when the plant becomes a prey of disease—little better than quite dead organic matter which gets fed upon and decayed by a thousand other germs.

Consider for a moment how different would be the case if the plant were feeding chiefly off the nitrogen air existing in the soil for the supply of these bodies. The excrescences being firmly affixed to the roots, having symbiotic action with the plant, being part and parcel of the plant, so to speak—the bacterial contents busy collecting the atmospheric nitrogen of the soil of which no lack exists, no tropical rains however lengthily protracted would or could denude the plant of its nitrogen. This source of nitrogen feeding would, too, better take the tree through protracted droughts, where again nitric acid would fail both times of the year

being precisely the times of disease. In fact were coffee dependent on a never-failing source of nitrogen—on that very strong and efficient source of atmospheric nitrogen—then the plant would unfailingly form, and in abundance, these bodies.

There were the times when none of these rich nitrogen-giving manures were used—this fruit tree taking the most insignificant amounts of mineral matters possible from the soil, such small amounts indeed that one would think it possible for the soil to itself naturally form these inassimilable form for the plant with little cultivation and without giving any manure as was the case for years and years with most prolific crops. Such, it is believed, would be the case to-day were this essentially nitrogenous tree depending on those root fungi which Dr. Janse thought fit and worth while to cultivate but on gelatine, unfortunately for only a short space of time and such matters needing much patience and bringing often many failures before the looked-for results are arrived at.

No one will deny that since the use of artificials, or in other words more readily assimilable foods where nitrogen predominates, those periods during rainfall and during the prolonged droughts when the tree more formerly than now, took the appearance of wintering, has, since the custom of giving nitrogen (and richly in assimilable form), been greatly over come. The tree where this is practised is not so typically the deciduous tree it was, nitrogen carrying it through such periods and this giving rich nitrogenous manures, which are capable of yielding nitric acid to the plant, certainly does give the tree far more the appearance of its old evergreen nature and it is natural it should. Not only is nitrogen the all-powerful means of supplying such materials as gums, sugars, albumenoids but it destroys wintering effects and keeps vegetation ever active. However poor and slight may be the effect of giving nitrogenous manure in overcoming this deciduousness (though in many cases this is not so) it is incomplete, often very ineffective and at all times most expensive but it shows the capabilities coffee would have of returning to its old nature of an evergreen if one could depend on a constant and uninterrupted supply of nitrogen at the roots—*i.e.*, if it fed on atmospheric nitrogen.

Already I have spent too long over a portion of the subject which seems to me extremely interesting and there seem to me very many questions connected with it and I have merely touched on the fringe of the subject. Briefly, it must be said here, that through the courtesy of Sir John Lawes an interesting investigation is proceeding which may throw much light on the question of whether our plants have changed the form of taking their nitrogen diet and whether we are still gradually changing it. I cannot forbear just entering into this here and hazarding a remark. The investigation is the comparative analysis of the very best Costa Rica obtainable against a sample of East India treated 12 years on artificials, and regularly so each year. My firm belief is, that Costa Rica, a young country comparatively for coffee, is producing this magnificent bean, without manure, without disease, with little expense in cultivation, as the result of feeding off *chiefly* atmospheric nitrogen, while we produce an inferior bean, with costly manures, with a vast deal of turning the soil to induce nitrate formation (principally). The usual result of plants feeding off atmospheric nitrogen is the presence of legumin as the nitrogenous principle in the seed. The usual result of plants feeding off nitric acid is albumen in the seed.

Will the Costa Rica show a great predominance of legumin while we show the nitrogen material as principally albumen? I believe it will be found to be so. While possibly Costa Rica may show 10% legumin out of its total say, 15 % nitrogen material, I believe that our total nitrogen products may not amount to more than 4 % to 5 % (of this particular sample of course) and that the albumen even exceeds the legumin possibly. If this be so, then there is the more urgent need of continuing and persevering till successful with Dr. Janse's cultivations.

I am quite aware I have laid myself out to criticism and ridicule first in stating that coffee is existing under a state of nitrogen hunger, second that it has under favourable conditions the power of feeding off atmospheric nitrogen such as the Leguminosæ and the other plants named. I mean to stick to my guns and show that this tree *is* to-day existing in this semi-starved state and that there is every reason for believing that these excrescences on the roots are merely the counterparts of the legumin in the bean and *vice versâ*.

Again I may lay myself open to blame if, in the following letters on the subject, I bring forward a statement *re* the coffee soils, though possibly not if in the end the statement proves correct. It is on the extremely low state of oxidation of the coffee soils believed to exist and a stubbornness to oxidise even when oxygen is freely presented to them, but if this is shown and proved as existing as a peculiar trait of these coffee soils it greatly enhances indeed the difficulty coffee would have of feeding off nitric acid source for its nitrogen.

Practical reasons by observation as well as analyses allow me to say that this very low state of oxidation exists and is general throughout perhaps all the coffee soils. It is bound to affect both the formation and retention of nitric acid, and I bring this forward as again a difficulty in believing this plant ever existed purely on nitric acid.

H. B. Evans.

COFFEE.

Sir,—In your issue of the 16th instant, "W" complains that, in my précis of Monsieur Conty's description of the coffee industry in Brazil, published in February, March and April last, I have put the value of the crop too high; because in 1898, grade No. 7 Brazil coffee was never worth more than 26s. per cwt in Santos, and often much less, whereas I quoted it at 31s. and 6d.

But I beg to point out that *I* only took Monsieur Conty's figures; and that Monsieur Conty did not say that the price *of grade No. 7* was 31s. 6d., but that the *average value of the coffee he was writing about* was 31s. and 6d. per cwt. at Santos. Probably a good deal of it was grade Nos. 1, 2, and 3, and very little of it as low as No. 7.

I do not vouch for the accuracy of Monsieur Conty's figures, but I do maintain that he is clearly a very painstaking man, and that his paper is a most able and interesting one. I think therefore that his opinions are entitled to a good deal of respect; and I would strongly advise all coffee-planters who can read French easily, carefully to peruse his article, in the original, that they may be able to form their own conclusions.

Coffee-Planter.

GENERAL ARTICLES.

THE POSITION OF COFFEE.

During the past few weeks there has been a considerable improvement in the Coffee Market, and for a short time prices practically reached 7 shillings per cwt. advance above the lowest point.

As we write, the market has a very steady appearance, after having fallen back about 18 pence per cwt.

We have pointed out to our readers and correspondents that, so far as we can judge, there is no stability in this advance. It was quite evident that the market was in such a state, rock bottom prices had been touched, and that in such a state of the market very little was needed to bring about a reaction.

When this reaction would take place and by what means it was impossible to conceive, but when the lever was supplied by those who were anxious to commence the running first by reported short receipts, and then by the news of the outbreak of plague in Santos, we saw that it was very probable that an advance of 10 shillings per cwt. was not at all unlikely.

So far, results have fully realised our expectations, and though the market is a little below the highest point reached, yet it will not come as a surprise to see at an early date this slight set back more than covered by a further improvement, as we cannot think that the prevailing feeling, which was the cause of the rise, has done with the market.

Be this as it will, the rise, although beneficial to many, will prove disadvantageous in the long run, for it will give a stimulus to those planters in the interior of Brazil who had come to the conclusion that the best thing to be done in face of such disastrous prices was to close down estates, and so the evil day will be put off —the brake which was to stay production on such a large scale will be left only to be applied at a later date.

How such reports could materially affect the market it is difficult to imagine. Had the crop estimate been given on reliable information as "much below last year," that would have been another thing, but it is well known that such is not the case, and that as large an outturn is expected, so far as Brazil is concerned. Our readers therefore must not think that the turn of the tide has commenced, although there has undoubtedly been a decided change for the better.

Consumption has been steadily increasing of late, no doubt helped by the more reasonable prices at which consumers have been enabled to make purchases, this is backed up by figures, but it must not be overlooked that in this respect a very wide margin remains to be consumed.

The chief cause of the improvement has been large speculation by those "in and out of the ring" (it is as well to mention that the slight set back reported above was caused by sudden selling on the part of certain speculators, and when this fictitious element has been withdrawn, prices will gradually return, we think, to the same unsatisfactory level of past months, in fact, we expect almost a repetition of last season).—*The Produce World.*

BRAZILIAN FINANCE.

Turning to the Treasury Blue-book just issued, it will be found that, although the service of the foreign debt and guarantees has been suspended to the amount of over £3,000,000 per annum, there is in reality no such relief for the treasury compared with the previous year; as from 1st July 1898 to 30th March 1899 treasury remittances to agents in Europe amounted to £1,717,669 as against £2,073,335 for the same period during the previous year.

In point of fact, although the service has been suspended and the £3,000,000, previously paid in specie, are now paid in bonds, foreign remittances still sum up to some £2,000,000 per annum, including: the repayment of the £2,000,000 issue of London treasury bills at the rate of £1,000,000 per annum, to be completed in January of the coming year; other guarantees not included in the funding agreement and the maintenance of the diplomatic corps, etc.

The fact is, as we have several times pointed out, the funding loan did not relieve us entirely from foreign payments on account of the debt, nor did it even very materially reduce the amount to be remitted compared with the year before (1897—1898), because the greater part of the service of the debt and guarantees was previously provided out of foreign loans and the sale of property, such as the issue of £2,000,000 treasury bills, a small balance from the 1895 foreign loan, the sale of Leopoldina debentures for some £700,000 and that of two cruisers to the American Government.

Had there been no funding agreement, in lieu of about £2,000,000, it would have been necessary to remit £5,000,000; the state of the exchange market at this moment clearly showing how impossible such a task must have proved!

In point of fact we are remitting almost the same amount today as we did in 1897.

Too much was expected of the funding agreement, which in reality served more to restore confidence and stop the unceasing fall of exchange than anything else. It did not relieve the market from supplying bills of exchange to Government, because within £100,000 the same amount was remitted in the nine months, July-March, 1898-99 as in 1897-98.

Very little of the improvement can, therefore, be attributed to the effects of the funding loan, except in a moral sense.

No doubt in that way it was a tremendous relief, but the real factors of improvement from 5 11/16d. in May 1898 to 6 27/32d. on 31st March 1899 must be sought rather in the feeling of greater confidence, created by the knowledge that Government was no longer obliged to remit the £3,000,000 for the service of its foreign debt; the very considerable reduction of imposts during the last two years and, consequently, of liabilities on this account; and perhaps, to a very small degree, to the initiation of the policy of withdrawal of currency and its destruction, which commenced in February of this year. . . . . .

As we explained in a previous number, it was unreasonable and contradictory for those who maintained that revenue was steadily decreasing to expect Government to meet current expenditure, burn notes, pay off old debts and convert internal gold issues into currency loans, all out of revenue without any recourse to credit at all. . . . . .

The Brazilian Government and people have undertaken a definite task and are overtaxing themselves, perhaps unwisely, and straining every nerve to carry out their engagement under most difficult and untoward circumstances.

They have nothing further to expect from their creditors.

Bonds may go up, or may go down; it can only have a sentimental interest here: nor will the opinion of the whole London press make very much difference in the long run.

But, when the country is so evidently doing its best, it may be fairly enquired whether it is wise or generous to not only minimize such efforts but to cast reflections on their honesty? . . .

As we have always maintained, the probability of renewing specie payment of the service of our foreign debt and guarantees depends principally on exchange.

With exchange at, or in the neighbourhood of, 12d. the task would be comparatively easy, as the cost of remittances for the service of the foreign debt would then be reduced from nearly 140,000:000$ in 1897 (including amortisations) to about 60,000:000$, which the collection of 15 % of import duties in gold would supply.

At present, however, the chance of exchange going to 12d. or anywhere near it, within a year and a half seems remote indeed. On the contrary the unassisted resources of the country seem scarcely able to maintain the ground already gained or to keep the rate from falling again.

Should exchange not improve before 1901, though specie payments may be renewed they cannot be long maintained, it being a proof that our economy is unable to support such an addition to the burden of foreign payments and, consequently, of the demand for bills without exchange giving way. If, whilst foreign remittances on account of the debt amount to less than £2,000,000, exchange can scarcely be kept from slumping, what will be the prospect in 1901, when they will have increased to nearly £4,000,000 per annum, should exchange be the same? Clearly, the market could not stand such an addition to the demand for bills.

It is true that S. America is a continent of surprises, and that it is *possible* that coffee may go up sky high and drag exchange with it. But is it wise or prudent to trust to mere eventualities in so serious a matter?

Government relies upon its policy of burning paper money to put matters right.

But, again, in face of late experience we must ask, is it safe to trust entirely to this expedient?

Unquestionably the continuous withdrawal of paper money must affect the value of what remains in circulation sooner or later, so long as no other factor is acting in a precisely contrary direction. But such action must be necessarily slow and gradual, whilst time is short and fleeting.

Circumstances are untoward; the sterling price of coffee is almost stationary; whilst speculation is rampant and now comes the bubonic pest to add an unexpected difficulty.

It seems to us that the time has come when measures of a more positive character should be taken to put the country in an unquestionable position to meet its engagements in 1901, by raising the value of the currency.

In the Central Railway there seems to exist a resource that properly utilized would not only serve to raise the value of the currency, and consequently of revenue, but to prevent it from falling again when raised.

It is requisite before 1901 to have not only furnished Government with the indispensable resources to meet its engagements without adding, if possible, further to taxation, but also to have so redressed the economical balance as to ensure foreign exchanges being, at least not unfavourable.

That can only be done by raising the value of the currency and exchange; and, unless it be done, 1901 will, we fear, come round and find us unprepared!—*Brazilian Review.*

ANALYSES OF SAMPLES OF COCOA.

The following Report on samples of Cocoa analysed has been submitted to the Planters' Association of Ceylon by Mr. Hughes in terms of recommendation made by the Cocoa Committee of that Association, that analyses should be made of the principal brands of Cacao in order to ascertain if any adulteration exists, which might prejudice the interests of Cacao Planters :—

Analytical Laboratory,
79 Mark Lane, London E. C.,
November 9th, 1899.

W. M. LEAKE, Esq.,
Ceylon Association in London,
61 & 62 Gracechurch Street, E. C.

DEAR SIR,—I have now the pleasure of sending you the results of my analyses of the nine samples of Cocoa sent me respectively on the 12th and 18th October. According to your letter of the former date samples marked:

			s.	d.
Cadbury's	9½ ozs.	for	1	4½
Army and Navy	8 „	„	1	3
Van Houten	8 „	„	1	3
Taylor's Condensed	8 „	„	1	6
Fry's Extract	8 „	„	1	5
Vi-Cocoa	6 „	„	0	9½
	8 „	„	1	4½

were purchased at the Army and Navy Co-operative Association at the prices abovenamed.

Samples Suchard's	8 ozs.	for	1	4½
„ Rowntree's	8 „	„	1	4½
„ Epp's Homeopathic	8 „	„	0	7

were purchased at the Civil Service Stores.

The analyses have been carried out fully according to your instructions, the results being insufficient in detail to determine to what extent adulteration and admixture with other ingredients prevailed.

I have added a few remarks which the results suggested and I trust the analyses will be of practical use both to producers and consumers of Cocoa.

Believe me, yours faithfully,
JOHN HUGHES.

ANALYSES OF SAMPLES OF COCOA.

Purchased respectively at the Army and Navy Co-operative Society, Limited, and the Civil Service Supply Association. By Mr. W. M. Leake, Secretary to the Ceylon Association in London:—

TABLE I.

Samples of Cocoa Essence consisting of pure Cocoa from which about two-thirds of the original fat has been removed :—

	No. 1.	No. 2.	No. 3.
	Cadbury's.	Fry's.	Army and Navy.
Price per lb.	s. d. 2 4	s. d. 2 1	s. d. 2 6
Water (lost at 212° F.)	3·99	4·30	3·10
Fat (Cocoa Butter)	25·01	30·70	37·20
Albuminoids and Theobromine	22·15	20.38	17·53

	100·00	100·00
Melting point of Fat ...	80°F	83°F
Containing Nitrogen ...	1 77	1 15
Containing Potash ...	2·68	·54

Mechanical condition: Fineness and state of granulation :—

Powder passed through sieve having 10,000 holes to the square inch	76·35	42·74
Residue left on sieve ...	23·65	57·26
	100·00	100·00

REMARKS.

From the above results it will be seen that in Table I. the chief variation in quality depends upon the amount of fat removed from the original cocoa, Cadbury's containing only 25·01 per cent. while the sample of the Army and Navy Stores contained as much as 37·20 of fat.

Pure cocoa contains originally from 50 to 52 per cent. of fat and from 2·20 to 2 35 per cent. of Nitrogen.

The removal of the fat renders the essence or residue richer in Nitrogen and in the other constituents of cocoa.

How far the removal of the fat should be carried is naturally an important point to be considered with a view of rendering the material digestible and palatable.

Doubtless some person will prefer cocoa rich in fat while other persons will prefer a quality from which more of the fat has been removed, consequently the selection must be a personal matter.

In Table II, the samples consist of cocoa with a slight addition of potash salts. Why potash salts should have been added is not quite apparent, as the quantity present cannot very materially affect the solubility of the cocoa, though possibly the digestibility may be somewhat improved thereby.

The figures show that there is not very much variation in the general composition of the four samples.

Table III, represents the composition of two well-known mixture consisting of cocoa and other materials.

No. 8. Dr. Tibble's Vi-cocoa contains 27·10 per cent. of fat and 2·77 per cent. of Nitrogen. Microscopical examination shows that the bulk of the material consists of cocoa to which small quantities of ground kola nut, malt and hops have been added.

Whatever may be claimed for it as "a restorative and stimulating food" by the makers the actul figures brought out in the analysis indicate that there is less nitrogen and more indigestible fibre than exists in well-known brands of pure cocoa.

No. 9. The last of these samples contains very much less original cocoa than any of the others. The figures for fat name 26·40 per cent. are very similar to those found in the previous samples, but the exceptionally low figures for Nitrogen 1·15 at once indicate that other materials must be present in the mixture.

On making a microscopical examination it is seen that consilerable quantities of arrowroot and coarsely crushed white sugar are present.

Probably one-half of the mixture consists of pure cocoa with the whole of its original fat left in, whilst the other half consists of the abovenamed ingredients.

MECHANICAL CONDITION.

The figures given under the heading of fineness and state of granulation represent the readiness with which the respective powders can be passed through a sieve having a mesh of 10,000 holes to the square inch.

GENERAL SOLUBILITY.

The claim so frequently set up by certain makers that their cocoas are soluble cannot be in any way supported by practical tests.

From a number of experiments recently made it was clearly demonstrated that the actual amount of cocoa rendered soluble by the action of boiling water continued for half an hour in no case exceeded 30 per cent; so that it is most undesirable that manufacturers should continue to put forth claims of superiority on the grounds of solubility. Cocoa is mixible, but certainly not completely soluble in hot water.

PRODUCE AND PLANTING.

Russian Tea.—The attempt at tea cultivation in the Trans-Caucasus has demonstrated that the tea-plant can be successfully grown in the country under existing climatic conditions, and, further, that it is only necessary to surmount certain difficulties at present experienced in respect to the question of obtaining cheap labour in order to make tea-growing an industry of the district. A large Moscow firm erected a factory on its plantations last year, and the authorities on the estate belonging to the Imperial domains at Chakva have followed this example, and have set up a tea-making establishment of considerable dimensions. The yield of the tea crop has been good, and, comparatively speaking, fairly abundant. But the Russians like good tea, and this Trans-Caucasian tea is far below the standard of Indian, Ceylon, or China. Seeing, however, that tea can now be successfully grown in this region, writes our Consul at Batoum, in a report on Trans-Caucasian agriculture, "the Imperial domain authorities propose to encourage the cultivation of this plant among the peasantry, and with this object in view would gladly split up the area on their estates now planted with tea into small plots for distribution, on certain conditions, to the surrounding inhabitants to cultivate under their supervision. It is considered that a measure of this kind would induce a considerable proportion of the peasantry to cultivate tea, and as soon as it is known that fairly remunerative wages can be obtained for the collection of the leaf, a large number of women and children would willingly come forward and assist in gathering the harvest, and by this means an important reduction in the price of labour would be likely to follow." So for the present, and for some time to come, Russia will want the usual supply from elsewhere, for our Consul takes care to point out that in the present difficult position of the labour market, owing to the absence of a good supply of labourers, it is evident that the expenses incumbent on the cultivation of tea in the Caucasus are so excessive that, if the production were to attain such figures as would enable even a small proportion of the demand to be satisfied, it could, nevertheless, not be sold at prices much below those which teas imported from abroad, and paying a heavy rate of duty, fetch in the markets of the Russian Empire.

Mincing Lane and the War Fund.—Mincing Lane has made a noble response to the Lord Mayor's Transvaal War Fund. In connection with the formal closing of the "Special Mincing Lane List" a meeting was held on Monday afternoon, in the London Commercial Sale Rooms, Mincing Lane. Mr. A. H. Rolls presided, and there was a large attendance of subscribers. The chairman remarked that, although that was the nominal closing day, it was proposed to keep the list open a little longer because it was believed that a number of firms who had not yet contributed were desirous of doing so. He thought they had reason to be proud of the total amount received—£11,060. During his long experience, he had never known a similar appeal which had evoked so much enthusiasm. He thought that the liberal way in which their foreign friends had opened their purse-strings was worthy of recognition. The success of the movement, he added, was mainly due to the valuable services rendered by Mr. H. Price, Mr. W. W. Green, and Mr. Andrew Devitt, and to the zealous manner in which they had been backed up by members of the tea trade, including Mr. W. T. Wilson, (Messrs. Gow, Wilson, and Stanton), Mr. F. S. Long, and Mr. J. Lloyd (Messrs. Lloyd and Carter). Mr. Price (hon. treasurer)

remarked that it was proposed to keep the clerks' list open for the present, as it was understood that at the end of the month a good many additional subscriptions might be expected from that source. There were between 20 or 30 cards still out. Several cheques had been received that day, including one for £100 from Mr. T Pink. The committee had so far sent £8,892 to the Lord Mayor's Fund. and they expected to forward a further £2,000 in a few days. No begging had been needed; the money had come in an unprecedented manner, thus showing that every one was of the same opinion with regard to the merits of the fund. We give on page II the list of contributions from merchants, growers and brokers. The tea dealers' names are not included, but the following were the principal subscribers:—John Lane Densham, Esq. (chairman of the Mazawattee Tea Co.,) £500, the Home and Colonial Stores £105, B. Densham, Esq., £100, Messrs. Brooke, Bond and Co. £105, Messrs. Appleton, Machin and Smiles, £52 10s., Messrs. Reinachs, Nephews and Co., £52 10s., and Messrs. Joseph Tetley and Co., £52 10s. A few firms have subscribed to the Mansion House Fund direct before the tea trade branch of that fund was opened; these included Messrs. W. J. and H. Thompson, £105, Messrs. George Williamson and Co., £52 10s, and Messrs. Shepard and Co., £50. It is expected that the list of tea-producing concerns will shortly be augmented, as we understand that the question of contributing to the fund is to be underthe consideration of the boards of a number of companies when next they meet.—*H. & C. Mail*

LOCUSTS.

The Government of India (Department of Revenue and Agriculture) lately addressed Secretaries to the Governments of Bombay and Punjab, and to the Chief Commissioner, Ajmere-Mhairwara, forwarding a copy of correspondence noted in the margin, regarding Dr. Edington's method of exterminating locusts in South Africa by means of a fungus disease, together with directions for using it, and remarked that if it was considered advisable to carry out any experiments, district and other officers might be informed that cultures of the fungus could be obtained from the Imperial Bacteriologist to the Government of India at Muktesar. A copy of this correspondence was forwarded to the Government of Madras "for information and any action that may be considered necessary." We extract the following for the information of our readers:—

From Surgeon-General L. D. SPENCER, M. D., Officiating Director-General, Indian Medical Service, to the Secretary to the Government of India, Department of Revenue and Agriculture, dated Simla, the 28th June 1899, No. 3471.

I have the honour to submit, for information and for any action which may be deemed desirable, copy of a letter from the Officiating Imperial Bacteriologist, No. 174, dated the 19th June 1899, regarding a South African fungus, which is said to have been found very efficacious in destroying swarms of locusts.

From the Officiating Imperial Bacteriologist, Muktesar, to the Secretary to the Director-General, Indian Medical Service, No. 174, dated the 19th June 1899.

I have the honour to report that I have recently obtained from South Africa a culture of the fungus, which is said to have been found very efficacious in destroying swarms of locusts in that country. I would therefore suggest that steps should be taken to bring to the knowledge of district and other officers in such parts of India as are liable to visitations of these destructive insects that cultures will be sent out together with instructions as to their use to any districts that may be invaded by them on receipt of a telegram asking for the same.

From the Imperial Bacteriologist to the Government of India, Muktesar, to the Director-General, Indian Medical Service, No. 262, dated the 18th July 1899.

With reference to your No. 3697, dated 10th July 1899, asking for further information on the subject of the locust-destroying fungus recently received from South Africa, I have the honour to enclose a note on the subject embodying such information as has yet been published, together with the instructions I propose to issue in regard to the use of the fungus, the latter being a copy of those issued by the Cape Bacteriologist, who first cultivated the fungus.

2. It will be seen from these that the fungus is a mould and is not pathogenic to any form of animal life other than insects, and that it has been already widely used in South Africa and other countries for the past three years without any deleterious results having been reported and is moreover easily used by natives with the best results. Further, it appears to have already been introduced into India, although by whom and with what results I am unable to say.

3. I stopped sending out the fungus for the present, on receipt of your letter, but as this is the best season for testing its value, I would request that early orders may be sent on the subject.

NOTE ON THE LOCUST-DESTROYING FUNGUS.

In 1896 a fungus, which had been observed to destroy locusts in large numbers, was cultivated on an artificial media by Dr. Edington, Bacteriologist to the Cape Government, and has for the last three years been used to destroy swarms of locusts in various parts of South Africa with great success during the last three years. It belongs to the entomoobthorea, a group of fungi, which for the most part live in the bodies of insects, but is not known to be harmful to any other class of animal life. The fungus stated by Dr. Edington in his last report to have been introduced into various parts of South Africa, North America, India, Australia and Buenos Ayres, and to have given most satisfactory results in various places. The fungus is sent out in culture in test tubes, and it is recommended to make the infection during moist weather, if possible, and in the evening This is accomplished by mixing the contents of the tube with two teaspoonsful of sugar and then add this to a tumbler of water in which small pieces of cork have been placed, and when the fungus grows use it to smear on some of the locusts or on the ground where they are swarming. Large quantities of the fungus may be obtained by keeping some of the locusts which have died of the effects of the fungus in a heap or in a pit for a few days and then powdering them up and using the meal thus obtained, which may be kept for a long time dry, by mixing it in the same way as the original culture was used. In Buluwayo 95 per cent. of the locusts are said to have been destroyed in one year while it has been even more successful in the native reserves than among European farmers, owing to the thoroughness with which the natives spread the fungus over the affected parts. During the three years it has been used in South Africa, no ill results have been observed from its use. It is most successful on the young non-flying locusts, but has also been of very great service among the flying swarms. Although it is stated to have been sent to India some time ago, I am not aware of any results of its use having been recorded. The method of using it is so simple that a native agency will be amply sufficient for using it.

Finally, I have recently fed both cattle and rabbits on it with no ill-effect whatever and there is no reason for believing that it is dangerous to any form of animal life other than insects as it belongs to the class of moulds and not to the bacteria.

(Signed) LEONARD ROGERS, M.D., I.M.S.,
Offg. Imperial Bacteriologist.

LOCUST DISEASE FUNGUS.

Instructions for use as advised by Dr. Edington, of Cape Colony.

Small tubes containing this fungus are prepared at this laboratory and supplied on receipt of a telegram reporting the presence of locusts in any district.

The methods mentioned below should be followed and the result carefully watched and reported to me.

During dry weather it is difficult to get the disease to spread and hence it is advisable to use it in moist or wet weather, and to make the infection of the swarms just before sun-set.

Directions for preparing the Fungus previous to use.

Open a tube and take out the contents entire; add it to two teaspoonsful of sugar, and rub the whole together with a spoon or flat knife so as to break up the material and mix it thoroughly. Then dissolve this in three-quarters of a tumblerful of water, which has previously been boiled and allowed to cool. Float in this a few pieces of cork, which have been previously steeped in boiling water and cooled.

Now cover the tumbler with a piece of paper, and let it stand during the day in a warm corner of the house or until the fungus is seen to be growing around the pieces of cork.

Method of Distribution.

(1) Catch some locusts, and after dipping them into the fungus let them go into the swarm again.

(2) Smear patches of damp ground, where the locusts alight to feed with the fungus.

(3) Confine some locusts in a box which contains some favourite food moistened with the fungus, and, after the food has been eaten, return the locusts to the swarms.

(4) Collect a large number of locusts which have died from the fungus. Dig a hole in the ground about 18 inches deep and one foot wide.

Strew some locusts over the bottom, then sprinkle some water over them. Repeat with locusts and again sprinkle until the hole is full. Do not press the locusts into the hole, but leave them lightly packed. Then cover over with a piece of tin or board and keep the hole thus carefully covered for four or five days. If very warm weather, four days will be sufficient, but if colder, a longer time will be required.

At the end of this time remove the locusts and spread them out in the sun for an hour or two or until thoroughly dry. Now grind them into a meal.

Of this meal, which may be kept dry for a long time until wanted, take two tablespoonsful, and add it to a large tumblerful of water, into which some sugar has been placed. Leave this in a warm place for 12 to 48 hours, and then treat live locusts by dipping, &c., just as one does in using the fungus when supplied in tubes.

Method of Application for young non-flying Locusts.

Take about one pound of white bread; dry it, and then grate it down into coarse powder. Put a cupful into a bowl and add enough water to make a watery paste. Add to this the contents of one tube of fungus and keep it in a warm place until the fungus is seen to be growing over it. Now place small portions where the young locusts are appearing and take care to see that where not eaten up the small portions are kept moist from day to day until they have been eaten.

Offg. Imperial Bacteriologist.

AMERICAN TEA.

Mr. Max Bennett Thrasher contributes to the *Hawaiian Planters' Monthly*, under the head of "Fifty Acres in Tea—The Experiment at the Pinehurst Tea Gardens," the most lucid account we have yet seen of Dr. Shepard's attempt to grow and prepare tea in the United States. A good deal has been written about this subject of late; yet we cannot but think that the following comprehensive paper will have a special interest for many of our readers. Mr. Thrasher writes:—

The only tea gardens in the United States are at Pinehurst, S. C. These gardens are the property of Dr. Charles U. Shepard, who for the last ten years has been experimenting with tea culture on a scale, and with a degree of thoroughness, neverbefore attempted in this country. Tea culture has been undertaken in a small way in the South at various times during the last one hundred years; the Department of Agriculture having frequently furnished seeds and plants for this purpose, but Dr. Shepard is the first person who can be said to have been successful in the business, and even he told me, when I visited his place recently, that although he had been in the work for so long it was not until the crop of 1898 was being harvested that he felt justified in saying that he had been successful.

Dr. Shepard's estate comprises about seven hundred acres, of which between fifty acres and one hundred acres are now planted to tea. This acreage is increased each year by the setting out of new gardens. It might be thought that so large an amount of land devoted to one crop would be spoken of as a tea farm or a tea plantation; but I have the authority of the Department of Agriculture for saying, that in all tea-growing countries the plantations are called tea gardens. "Whether the area under cultivation is one acre or one thousand acres, it is recognized as a garden, and in all features of this industry, this appellation is universally employed." Parts of the estate which differ in the variety of the plant, or in the date of setting out, are spoken of as different gardens. One of the oldest and most flourishing at Pinehurst is known as the "Rose Garden." It takes the bushes in a garden four or five years, from the time of planting, to grow large enough to be picked regularly. Once established, though, Dr. Shepard says, he sees no practical limit to their productiveness, since some of the best gardens in China have been picked regularly for two hundred years. After a bush has reached maturity it can be picked once in ten days during the time of harvest which, in South Carolina, extends over the six months from May to October. Only the tips and first leaves are picked. Each new growth which admits of picking in this way is spoken of as a "flush," and the word "crop" applies only to the yield of the entire season. The bushes, when in good condition, are about three feet tall, and look like well-pruned willows, although the leaves are a little darker and more glossy. The green leaves when chewed have a pleasant aromatic taste, not unlike that of the little New England plant known as "pipsisseway."

Pinehurst is two miles from Summerville, and Summerville is twenty miles inland from Charleston, on the line of railroad which connects that city with Columbia. When I rang the bell at Pinehurst and asked for Dr. Shepard, word was brought me from that gentleman that he was busy at the tea-house at work which he could not leave, and would I not come out to him there. I found the tea-house to be a neat two-storey wooden cottage, standing, like all the buildings of the place, beneath superb Southern pines. The tall, straight trunks of these trees, branchless, until far above the houses, and the softened light which their interlacing boughs sent down to the ground, made me feel all of the time that I was at Pinehurst, as if I was walking between the pillars of some vast old English cathedral.

Dr. Shepard was just weighing a pick of green leaves. He stood inside an open window of the tea-house, with a set of scoop scales on a table before him. On the veranda outside the window, or on the ground in front of the tea-house, were some thirty negro boys and girls of various ages. The boys, were small; some of the girls might have been sixteen or seventeen years old. Each one had an ordinary trout basket slung by a strap over one shoulder. The docter would call out "Jinny" or "Sam" or "Hannibal," and the owner of the name would step to the window, unsling his or her basket and hand it in. The contents would be turned into the scood of the scales, weighed, and the amount credited to the owner's name on a check-list which lay on the table beside the scales. Some of the older pickers tallied over two pounds: others had only a few ounces of green leaf. While the green tea leaves are being picked they must not be packed tightly or allowed to lie long in a mass, because, if they do, fermentation or a process very similar to it, quickly sets in. On this account the pickers are not allowed to stay out longer than two hours at the most before bringing their pick to the tea-house to be taken care of. Trout baskets have been found convenient receptacles because the tips or leaves can be dropped one by one through the square hole in the cover and lie lightly in the basket until removed. The children are paid at the rate of so many cents a pound for the green leaves, and are supplied with a wholesome lunch. A good picker will make from 30 to 50 cents a day. They are all neat, both in dress and in person, a fact which is pleasant to remember when one is drinking Pinehurst tea.

The question of how the tea should be picked, was one of the most serious problems which Dr. Shepard had to consider. This part of the work must be done by hand, and the difference is the price of labour in the United States, and in Asiatic countries will always increase the cost of tea grown here. The cost of picking in India or Ceylon is only a fraction of a cent for a pound of dry tea. In South Carolina the cost is from six to ten cents. Experience has shown that a bright boy, or a grown girl, can pick from a good flush about twenty pounds of green leaf in ten hours. This quantity ought to make about five pounds of dry tea. Even with the question of wages put one side, Dr. Shepard found himself embarrassed for pickers. If he was able to get enough hands for one flush, there was no certainty that they would be available when the next flush was ready.

Dr. Shepard finally evolved a scheme which has worked excellently, and which has seemed to me to be, in itself, a worthy piece of philanthrophy. He built a comfortable school-house and equipped it with all the requisites for successful teaching. Then he hired a competent teacher and invited all the coloured families to send their

children to school, and they would also be taught all the branches usually taught in a primary school, and they would also be taught to pick up tea, and given an opportunity to earn money to help buying food and clothing. The offer was favourably received, and the school has a large number of scholars from whom such pickers as are required are drawn. Many of the children when they first come to the school are too small to work, but they soon acquire the strength necessary. At first they have to be very carefully taught. While I was watching the children at the tea house, one boy turned in a basket in which there were so many coarse leaves that he was severely reprimanded by the doctor. The other children hung their heads as if they were ashamed for him.

After the leaves were weighed they were collected in large tin tubs. When a tub was filled it was carried into one of the upper rooms in the tea-house and the leaves spread thinly on the floor to be "wilted" As soon as the leaves have been sufficiently softened in this way, they are put into a hopper worked with a peculiar oscillatory motion which rolls the tender leaves into the tight little cylinders of commercial tea, and at the same time breaks the oily cells so as to make the contents readily extracted when boiling water is poured on them. The hopper, which is run by steam power, is of copper-burnished outside and in, until it shines like gold, and the floors where the leaves are spread to wilt are clean enough to eat from The rolling by copper machinery, too, is certainly preferable to hand rolling. After the tea comes from the hopper, it is still damp; and before being dried, is set in shallow pans in a room where the temperature can be delicately adjusted to moderately high degree. A few hours here accomplished a change, once thought to be simply that of fermentation, but now more accurately described as oxidation. This changes the colour of tea, darkens it, and makes it what is known as "black" tea.

Most people suppose, unless they have visited a tea garden, and have seen the process of manufacture, that "black" tea and "green" tea differ, because made from different species of the tea plant. This is not so Certain varieties of the plant have been found better adapted for making one kind than the other, but the real difference comes wholly from the process of manufacture. Leaves which are to be made into "green" tea are not wilted, nor are they subjected to the process of oxidation. As yet the Pinehurst house makes only "black" tea, but Dr. Shepard told me that he hoped at some time to introduce the processes necessary for making "green" tea. After the process of oxidation is completed, the tea is dried and packed. Dr. Shepard packs much of his in neat tin boxes, holding pounds, or fractions of a pound. Tea made from the contents of boxes which he gave me has been greatly liked by persons to whom I have given it. The flavour is much like that of English breakfast tea.

In picking the tea only the tip of the shoot and the most tender leaves are taken. The number of leaves picked with the tips, gives us certain other familiar terms, associated with tea, but the real meaning of which I had never understood. If only the tender, unexpanded leaf-bud at the end of the shoot is taken the tea is called "Flowery Pekoe." If the first leaf, almost as tender as the bud, is included, it makes "Orange Pekoe." If the second leaf, slightly firmer, goes in, it becomes simply "Pekae tea." The addition of the next two leaves, in the same way, makes first and second "Souchong." At Pinehurst never more than the second Souchong leaf is included.

In order to insure a vigorous fresh growth, from which a succession of pickings can be had it is necessary to prune the bushes freely. The pruning is done in the winter. The native home of tea plant was in the dark and sickly swamps along the Brahmapootra River. In the moist forests there, unpruned, the plants attain a height of thirty feet. The botanical name of the tea plant is *camelliathea*. It is a near relative of the familiar hot-house plant. *camellia Japonica*. It is probable that the tea plant was introduced in China and Japan, as much as fifteen hundred years ago. In those colder climates varieties have been developed which are much dwarfed. The two best-known varieties now are the Chinese and the Assamese. Dr. Shepard has experimented with seed from many countries, often brought here at very great expense. The seed comes packed in dry, powdered charcoal, in a hermetically sealed metallic case, the latter enclosed in an iron-bound wooden-box. Eighty pounds of tea seed is called a "maund," and should contain about 30,000 seeds, but the life of the embryo is so delicate that only a small proportion of these will germinate.

The seeds are planted in the fall When they begin to come up it is necessary to protect them from the direct rays of the sun. and at Pinehurst one sees, what looks from a distance like gre villages of South Sea Island houses. These prove to be platform thatched with palmetto leaves, built over the beds of seedlings.

Dr. Shepard tried innumerable experiments in drainage, fe tilizers, cultivation and curing, before he arrived at the degree success which he now enjoys. A brief resumé of the history of th "Rose Garden" will given the best idea of the methods and result employed at present. The site of the "Rose Garden" was an ol piney wood pond. The ground was thoroughly drained, sweetene with burnt marl and deeply plowed. One thousand plants Assam-hybrid tea were set out, six by six feet apart. The area not quite an acre. The garden was planted in 1890. At presen the garden contains about 800 vigorous plants and 200 younge plants which have been set out to take the place of those whic have died The crop has risen from 150 pounds of green leaf i 1894 to 1,200 pounds in 1898, the equivalent of very nearly 300 standard Pinehurst dry black tea. This year's crop will be muc larger Dr. Shepard calculates that the cost of this was 27½ cent a pound, but thinks increased acreage will lower the cost of pro duction a little. Two other large gardens planted with Darjeelin seedlings promise to rival the "Rose Garden" in a few years . . Dr. Shepard has summed up his conclusions as follows:—"The Ros Garden has apparently demonstrated that commercial tea can b successfully grown in South Carolina. The utilization of thi knowledge may be along several lines, but they all involve th erection of a suitable factory, costing from a few thousand dollar upward, according to the proposed scale of operations. In som countries the bulk of the tea leaf is raised by small farmers who at the most, only prepare it sufficiently to insure its safe delivery at the factories in the larger and often distant towns. In othe countries the large estates erect factories which will handle thei own output and that of the small producers.

"There is a large class of people who might profitably add th cultivation of tea to that of fruit, flowers and vegetables, filling out the corners of their garden with tea bushes, as they do i China, or substituting useful as well as ornamental evergreen hedge of that plant for the present unsightly and costly and frequently unreliable fences Cultivated in this way, the outlay of time, labou and money, could not be burdensome; and, as one result, the house hold would be able to supply its own tea, pure, strong and whole some, instead of the 'wishy-washy' stuff, often far from cheap generally sold throughout the country.

"As these little tea gardens are extended and multiply, factories will be established in each neighbourhood for the larger manu facture of commercial tea, whether the products of the surrounding gardens can be brought and sold, precisely as canning factories and dairies consume the surplus production of fruit and milk."

CACAO CULTURE IN ECUADOR.

The following information relative to cacao culture i Ecuador is a translation by Consul-General DeLeon, Guaya quil, of a paper prepared by Señor Gonzalez Bazo (Secretar of the Guyaquil Chamber of Commerce) a prominent busi ness man of that city:—

Cacao pertains to the botanical family of the *Malvacius bictner ces;* it is the *Theobroma cacao* of Linnæus, of which various specie are found in Ecuador.

It is believed that cacao came originally from Mexico, where i was cultivated by the Aztecs long prior to the Spanish conquest The history of Ecuador does not record when the plant was intro duced here. It is stated that the annual production in 1741 wa from 35,000 to 40,000 cargas of 81 pounds each.

Cacao in Mexico was called "cacari" or cascara quahuitl, an the product was called "chocolatl," from which the word chocolat is derived.

EXTENT OF PRODUCT.

Cacao is produced in five provinces of the coast:

Province.	Number of Trees.	Yield.
		Quintals 101·61 lbs.
Los Rios	30,000,000	210,000
El Oro ...	6,500,000	60,000
Guayas	6,000,000	50,000
Manavi ...	4,000,000	30,000 to 35,000
Esmeraldas	700,000	8,000 to 10,000

CLIMATIC CONDITIONS.

Cacao requires a very warm and humid climate—26 to 30 degrees C. (77 to 86 degress F.)—and copious rain. Rainfall and heat generally determine the annual productivity; but in some years, despite favorable seasons, crops are poor, and *vice versâ*. Strong winds cause damage, and large trees are planted to protect the cacao trees.

HOW PLANTED.

Cacao is planted from fresh seed. Four or five are put in each hole, which are 5 yards apart, in rows.

MATURITY.

In the sixth or seventh year, the tree commences to bear, but the pods at this time are very small and scarcely repay the effort to gather them. In the tenth year, the tree reaches full maturity. It then produces on an average 1 pound of dry cocoa of good quality. There are many trees which produce more, especially those which are isolated, some of which have yielded at one picking as much as 7 or 8 pounds. In the province of Oro (Machala), 1½ to 2 pounds per tree is the estimated yield The tree is in bloom during the entire year, but most of the blossoms fall before fructification, which occurs twice a year, the time varying with the locality

DESCRIPTION OF TREE, FLOWER AND FRUIT.

The cacao tree grows to a height of 20 or 30 feet; its leaves are evergreen and lanceolated in form; the base of the main trunk attains a thickness of 8 to 10 inches; the bark is hard and of greenish coffee color. The blossom is very small, pinkish white, and waxlike in appearance. It grows directly out of the main trunk and branches. If it fructifies, the petals fall off, and from the stamens, in the course of from fifty to seventy days, an oblong pod is developed. This pod is of golden color, and contains some twenty to thirty-five grains of cacao, enveloped in a gummy liquid, which coagulates on exposure to air. The outer rind of this pod is dark or golden yellow in color and very hard, a sharp instrument being necessary to cut it open. Its size varies, according to the kind of cacao, from 8 to 15 inches long by from 2 to 6 inches thick The outer rind is marked by longitudinal furrows, more or less pronounced, which indicate the interior arrangement of the seeds. Both the outer rind and the gummy contents of the pod are porous and blacken in color as soon as picked, and in Ecuador are of use only to fertilize the soil upon which they are cast.

The seed or bean of the cacao is about the size and shape of a large almond. It contains the active principles of theobromine, albumen, phosphates, fatty matter and water. When dry, it is vitreous in appearance, covered with a skin more or less delicate which is easily removed and which contains a distinct pellicle. The color varies from dark coffee to violet, the latter indicating an inferior grade.

HOW GATHERED.

As soon as the pods begin to ripen, they are removed with pruning knives, very sharp, and attached to the ends of long poles, which are lengthened by joints as often as required. As the twigs are very tough, the blow with this instrument must be strong and well aimed, and the laborers must be experienced on account of the particular skill that is required and the fatigue that attends handling heavy poles sometimes 30 feet long, with the face continually upturned.

Wherever they can be reached, the pods are cut off with a machete. Considerable cacao is lost by the carelessness of the laborer and his dislike to bother with the pods in the upper branches.

HOW PREPARED.

The pods are heaped in piles by one set of laborers, while another cuts them open and extracts the contents. A sharp pruning knife is used, and the seeds are often damaged through carelessness. For extracting the gummy substance and the seeds, an instrument made of a beef rib is used.

The drying is done on open platforms made of split bamboo and palms, where the cacao is exposed to the sun during three or four days, and, in order that it may dry uniformly and well, laborers are employed to tread it out with bare feet. If not well dried, the bean is apt to ferment, and if excessively dried it shrinks and finally turns black. The driers are provided with covers for protection against rain.

Attempts have been made to introduce drying machinery (steam), but at present not one plantation in Ecuador uses it.

HOW MARKETED.

When dried in the primitive fashion stated, considerable pulp yet adhering to the grain, the cacao is sacked and sent to Guayaquil to be sold in its natural state. Some merchants attempt to deceive the buyer by washing an inferior bean in achiote, which gives the skin the appearance of first-class cacao; but this practice is severely condemned by honest merchants and is seldom followed; nor is reddish earth used here, as it is elsewhere, for the purpose of preserving the grain from decomposition and of increasing its weight.

Reaching Guayaquil, the cacao is subjected to the cleaning process. Splinters, dirt, and defective beans are eliminated, and the adhering clusters of beans broken apart and dried several times before shipment. During this process, the cacao loses 4 to 5 per cent. in weight. The sacks for foreign shipment contain from 60 to 70 kilograms (132 to 154 pounds) net. The largest portion of the crop is bought in advance by Guayaquil merchants engaged in this business, who loan considerable sums of money during the year for current expenses of cacao estates. Large capital is necessary, and the number of merchants engaged in the business is limited. Formerly 12 per cent. interest and 2 to 5 per cent. commission were charged on advances; but now, owing to competition, commissions are no longer asked and interest has been reduced to 8 per cent. to planters.

COST OF CULTIVATION.

The cost of cultivation is small, not exceeding 6 to 7 *sucres* ($3.000 to $3.50) per 100 pounds, delivered in Guayaquil. This includes management, cleaning, weeding, harvesting, drying, transporting, and every possible contingency, except interest on the capital invested.

CACAO PRODUCTION OF THE WORLD, 1897.

	Tons.
Ecuador	22,000
Trinidad	10,000
Other British West Indies	9,000
Portuguese Africa	7,700
Brazil	7,500
Venezuela	6,000
Dutch Guiana	4,500
Haiti	4,000
Colombia	3,000
Ceylon	1,650
Java	1,000
Guadeloupe and Martinique	800
Santo Domingo	150
Niger Coast	55
French Guiana	30
Kongo	5
Total	75,680

Mexico and Central American republics produce only enough for local requirements. Ecuador's production for 1899 is estimated at nearly 30,000 tons.

CONSUMPTION.

The consumption has increased notably, and at a rate exceeding that of coffee. Prices will remain firm for an indefinite time, by reason of the long period necessary to bring new trees to maturity. The consumption in four leading countries is as follows:—

	Germany. Tons.	France. Tons.	England. Tons.	United States. Tons.
1894	10,000	...	...	8,800
1895	13,758	15,243	10,397	16,800
1896	17,123	15,280	10,984	11,600
1897	20,196	16,234	12,135	15,700
1898	...	...	14,325	14,200

USES OF CACAO.

Cacao is the principal element in chocolate and various kinds of confectionery. As an article of food, it is very nutritious, healthful, and stimulating. The "butter" of cacao is well known in medicine, and is used in the cure of skin diseases of all kinds with good results. The shells of the seed, roasted and ground, are used for "cocoa," a drink well known in the countries of the temperate zone, but used here only by the poorer classes. The pulp of the pod is used as fodder for animals The popularity of cacao rapidly increases wherever it is once introduced, and neither fluctuations in prices nor attempts to substitute other products supposed to have the same or better qualities have affected its use in localities

it is once well known. The active principle of cacao is "theobroma," a powerful organic re-agent.

FIELD FOR ENTERPRISE.

The possibilities of the cacao market are vast. The consumption has not yet begun, or at least made any headway in the Asiatic countries, among which Japan, Persia, and British India may some day become important consumers. Chocolate is scarcely known in Oceanica, the British colonies, or Hawaii. Even in Europe, Russia, Turkey, and Greece are but recently becoming familiar with the product. As there has always been a ready market, no special effort has been made to extend the demand to new countries.

While some progress has been made in the utilization of the shell and pulp, no attempt of importance has been made to manufacture the product for export, although there is plenty of vanilla and sugar available for the preparation, and the profits would be considerable. Ecuadorian cacao, being somewhat bitter, has an advantage over that of other countries in assimilating a larger amount of sugar in the manufacture of chocolate, thereby reducing the cost of the product.

The consumption of cacao is increasing at the rate of 5 or 6 per cent. annually, and inside of eight or ten years the demand will be greater than the supply. The attempts to introduce cacao on a large scale in various other tropical countries has not been attended with favorable results. In no other part of the world can its cultivation be brought to the flourishing condition which prevails in Ecuador, where there is still a vast extent of land suitable for new and productive estates. All that is necessary is capital and energy, which will be welcomed, and which will surely come when the railway to Quito is built, for no line of agriculture shows such tempting returns.

WASTE IN NATURE.

In former days Nature was supposed to be "absolutely perfect" in all her ways, and everything had its use, and was used. Anything like waste was thought to be impossible, as unworthy of her methods of procedure. A more careful investigation shows that waste is really enormous. By waste, I mean loss of structures which evince some definite purpose, are produced in profusion, but yet in innumerable instances they have no opportunity of being put to their uses, and perish.

The cases most evident are connected with the reproductive organs; roots and leaves are put forth in response to stimuli arising within or without the plant, and scarcely fall under this category; but regarding flowers, fruit and seed, as the means of propagation, it is among these that probably few persons realise the vast amount of energy displayed in their production compared with the feeble results which often ensue.

It was on the assumed superabundance of offspring produced, that the theory of natural selection, as a means in the origin of species, was based; but few statistics were forthcoming to test the truth of the hypothesis—or if it were true in some cases, whether it was true in all. Let us consider a few instances, and first, with regard to the quantity of pollen produced. It is believed that the nucleus of a single pollen-grain can impregnate a germ-cell, and so give rise to an embryo in a seed. But numerous flowers bear but one seed in the ovary-cell, as of the largest families, Compositæ and grasses. In each floret of the former there are five stamens, and each of which produces an abundance of pollen-grains. Labiatæ and Borragineæ produce at most four seeds in each flower, accompanied by four or five stamens respectively; the Spurge-Laurel bears one seed and has eight stamens; and so all through the flowering world, numerous other examples may be mentioned, especially perhaps, among the Coniferæ, the pollen of which is often wafted away, as from a Fir-tree, like a cloud of sulphur, and is lost in the breeze.

Again, although a plant, herb or tree, may bear a profusion of flowers, the proportion of fruit is often almost infinitesimally small compared with it. Take our horse-chestnuts, lilacs, elms, and limes, what a wealth of blossom they bear, yet on each spike or cluster of the first two, one or two fruits remain to bear witness to their former glory, while the half-formed fruits of the last two fall without perfecting a seed. Especially is this the case with orchids. Mr Fitzgerald records the observation that in a particular plant of *Dendrobium speciosum* (the "Brisbane Lily") there were no less than 10,000 flowers open at the same time on that plant, [illegible] the plant was growing in the open air, and was [illegible] of insects, only one flower produced a seed-pod.* Mr [illegible] Mr. Ridley both observed that it was the self-fertilising orchids which alone can be trusted to set any quantity [illegible]

Few of us were aware of the great preponderance of fruits and seeds borne by many plants, and Dr. J W. Harv has done good service in calling our attention to this m correcting our erroneous and preconceived notions on th During several summers he has taken statistical observ order to determine what was the successful termination of fertilisation. He did not take into account all of t concerned, such as the weather, which, of course, influe production, nor how far the plants were shaded, which reduces the flowering process; nor, again, the number visitors, &c. Still, his tables possess much value.

Taking a perfect fruit as one well matured, and an abo as more or less shrivelled and seedless, he found that in *Ar phyllum*, Torr., of 13 plants there were 144 perfect, but 53 fruits, or only 20 per cent. of the former.

Of *Rhododendron* (Azalea) *nudiflorum*., Torr., there 4 perfect, fruits on plants, but there were 90 abortive.

Of *Cornus florida*, L., of 34 clusters on one bush there perfect, and 453 or a little over 32 per cent. of good seed.

Of *Yucca filamentosa*, L. (Adam's Needle), the auth ves:—"This liliaceous plant is of considerable interes biological standpoint, owing to its dependence upon *Pronuba yuccasella*, Riley, which passes part of its larval in the capsule of the plant, feeding upon the seeds. previous to depositing its eggs in the soft ovary, polli stigma by placing a ball of pollen from the same flowe the three stigmatic lobes. This insures the production seeds, on which the larvæ feed." In the tabulation of the which, besides the numbers of good and aborted seeds the number devoured, &c., the final result of observat eight capsules, each of which contains six rows of seeds, is t 35 per cent. remain good for propagation.

Of *Pimpinella integerrima*, Benth. & Hook., 6 plants amined, carrying 174 umbels. Of these, about 80 per cen seed was the result. Lastly, of *Hibiscus moschatus*, L. last instance the preponderance was in favour of good s about 75 per cent.—*The Gardeners' Chronicle.*

CARDAMOMS (ELLATARIA CARDAMOM

Mr. John Dansey writes in the *Queensland Agr Journal*:—

The cardamoms of commerce are of two varieties, Malabar and Mysore; the former bearing capsules of from long, the latter of about 1 inch in length. In appearance much resembles ginger, but, unlike the latter, the flowerin spring from the roots. These yield the fruit, which co triangular three-celled capsules, enclosing number of sma seeds possessing a very strong aromatic odour and a pungen

Cardamoms are in much request throughout the East I amongst chemists, all over the world, command a ready For years past, the principal supplies of cardamoms h obtained from Southern India, but latterly from several Ceylon, where, with usual energy and perseverance, plant taken up their cultivation on a large scale, and with con benefit to themselves. In Ceylon, cardamoms grow well tions of from 1,500 to 4,000 feet. Slightly undulating la the banks of streams, the soil of which is a rich and must l be found most suitable to their growth.

For the propagation of this plant nursery beds should be in the usual manner, and the seed sown in drills from 6 t apart. These seeds are slow of germination, from two months elapsing before they show above ground. When t are of about 12 months' growth, and about 12 to 15 inc they may be said to be fit for transplanting. Having cut undergrowth and all small trees growing on the land on w

intention to plant—leaving only sufficient standing timber to ord a moderate shade—holes, 1 foot 6 inches deep and two feet le, should then be dug at distances of about 5 feet apart, in ch, after being filled in the usual manner the young seedlings planted, care being taken that they are not put in too deep for, o, they are likely to rot and die off. The second year after nting out they will yield their maiden crop, and in the third be said to be in full bearing, when an acre should yield on an rage from 200 lbs. to 270 lbs. per annum, though 350 lbs. are not nown. The crop itself should be gathered when still green, and before turning to a yellowish straw colour, for, should the sules be allowed to ripen, they will at once "pop," and the seed lost.

he fruit when fit for gathering resembles as nearly as possible reen gooseberry, only that, instead of growing away from the n as gooseberries do, these spring from a thin long vine as pés do, but growing always along the ground, and for this rea- mulching of any kind, after the plants have attained maturity, uld be avoided.

n harvesting cardamoms of either variety, it is necessary to go r the field at least twice a week and pick off the full capsules . These, when gathered, should be carefully washed in two ers, so as to remove all sand and inpurities, which, from the ure of the fruit growing along the ground, are bound more or to adhere to it; this having been done place them in the sun dry, turning them carefully once or twice in the meantime. e should here be taken only to allow just sufficient time to dry; much exposure to the sun will cause the capsules to split and their contents. When quite dry, spread the fruit out in a loft w it to wither for from 12 to 15 hours.

ardamoms to be made marketable require to be bleached. s, though seemingly ridiculously easy, requires nevertheless a l deal of watching, for should the fruit be too long exposed to process, the seeds will attain a light brownish colour, instead eir natural black, and lose much in value. For the purpose of ching, it will be necessary to have ready, by the time the ering has been completed, a wooden box, much resembling a ry box (as airtight as possible), with slides so as to admit a ber of trays, bottomed with thin Hessian, to be inserted therein istances from 8 to 10 inches apart. The withering being com- ed, dip the cardamoms in water for a few moments; then place on the trays to the depth of from 2 to 3 inches the box. When he trays have been treated alike, place on the ground inside box, and not within less than 2 feet of the lowest tray, a bucket me such receptacle containing burning charcoal, over which, n all is ready, throw a full handful of powdered sulphur. Then the door quickly and as tightly as possible, and allow the ching to go on for from 15 to 20 minutes, when the door may pened, and the trays emptied out on the same clean Hessian, the contents allowed to dry thoroughly in the sun. When dry, lends of the capsules are taken off with the aid of a sharp ors; they are then sized and packed for market, preferably ad-lined boxes, as many shipping companies object strongly rry cardamoms, unless so packed, on account of their strong matic odour.

AGENCY CHARGES OF TEA COMPANIES.

e following criticism of our articles upon "London Charges of Companies," dealing chiefly with the last article, has reached We give prominence to the remarks of the writer, because by g acquaintance with the tea industry, yet neither interested tly as a producer or dealer in the article, he has enjoyed ex- onal opportunities for noting with impartiality the effects of vils complained of. Regarding his point about the difficulty ding enough planters capable and willing to go upon London ls, we would ask: How often have companies tried to find men? Has it not, in fact, been the last resort instead of rst?

ave read with considerable interest the articles contained in t numbers of your paper regarding the London and other ges paid by the Indian tea-planting companies, and I now have e me your article No. 4.

ving devoted the last fifteen years specially to Indian tea anies as investments for British capital, I feel constrained to ssue with you.

Firstly, while admitting that there may be a large measure of truth in what you say regarding the superfluity of Calcutta agents, I believe that there is still room, under certain restrictions, for their employment. Of course, no one can deny that on the condition that a London board of directors is able to attract to its ranks at least one practical planter, having recent experience of planting, in the district where the company's property or properties are situated, and that that gentleman's services can be obtained to periodically visit the estates, and thus keep in close touch with the garden management, and the garden expenditure and arrangements generally. Then the intervention of Calcutta agents, except in the capacity of mere forwarding agents on a nominal remuneration, is wholly unnecessary But it must not be overlooked that the number of men willing or capable of giving such service is strictly limited. It is in default of such service that the rôle of the Calcutta agent—whether an individual or a firm of good repute—comes in, and his services may be of considerable value and command a fair remuneration. But I am quite at one with you in your contention that in that event his office should be strictly subordinate to the London board of direction, which should occupy the controlling position, with own secretary or manager; while the aboard and their home staff, and they alone, should be responsible to the shareholder.

What has no doubt aroused your suspicions, Mr. Editor, and not without some cause is, that in the accounts of so many of the companies—accounts which are otherwise, so far as garden expenditure is concerned, given in great detail, the amounts of commission are rarely shown separately in the revenue account. There are some notable exceptions, I am aware, where every charge is given separately in detail, whether in India or London.

Where, however, the system of Calcutta agency supervision has, of recent years, in many cases broken down, is in such supervision having become a matter of form, relegated to subordinates, without a sufficient or an intelligent knowledge of local conditions, and this remark applies also in certain cases to London agency and supervision.

I cordially confirm your opinion—we *must* admit it—that the excessive extensions, which have well-nigh ruined the industry, of recent years have in many cases been pushed on by agents and others desirous of increasing commissions, which as frequently (and quite seriously) calculated on gross proceeds instead of by fixed allowances or by commission on profits. At the same time, we must admit, in fairness to agency firms, that a similar policy has also been followed, in many cases, by boards which were entirely independent of agents.

Dealing finally with your proposed remedies:—

1. A planter to be on the board.—This I have fully dealt with above.

2. Superintendent at garden to have wide powers.—Yes; provided he has proved himself fully worthy of this trust. It must not, however, be overlooked that some of the most disastrous failures have been the result of a blind faith in a superintendent or manager who has been "given his head" too confidently over a long series of years. This evil can only be prevented by *close touch* being kept between either the London board or Calcutta agent and the local management.

3. Calcutta agency remuneration certainly should be by a fixed allowance, and *not* by a commission on gross value of tea—this latter system being a most pernicious one; and the same as regards agency, if any, in London.

4. Of course, there should be no secret commissions. If agents or others consider that the *above-board* allowances granted them is insufficient, and if they can show that good service is rendered, shareholders or directors, as the case may be, can always be appealed to, to set this right, and doubtless would do so.

I can only conclude by thanking you for your appeal to shareholders to bestir themselves, to look after their interests in these matters. This advice is well merited. When I remember the numberless annual meetings of tea companies (many of them with long lists of shareholders) which I have attended, at which often merely a poor half-dozen members have been present, the reflection occurs to one. "How marvellous that abuses are not much more flagrant!" It is not only that few shareholders ever attend or give tongue to complaint or adverse criticism; it is that they rarely take the trouble to give a word of thanks or praise to the administration, even when that is well deserved.—*Investors' Review.*

THE MALARIAL MOSQUITO.

Malaria has formerly been associated with low-lying moist districts, and the means taken, up till quite recently, to stamp out the disease, have usually been in the direction of draining and cultivating the land on which the disease has been prevalent. This method of treatment has proved effective in England and America, but in tropical countries the scourge has remained in spite of the application of the above means for its prevention and cure.

The disease was supposed to be dependent upon moisture for its being, and it has been found impossible, for financial reasons, to throughly drain all the malarious land in tropical countries.

Malaria has, for many years, been known to be due to a parasite in the blood, but until very recently little had been done in the way of scientifically investigating the manner in which the infection obtains admission to the body. For about a century we have been told that malaria is carried by insects.

In 1884, Laveran and Flügge accepted the insect-theory, as did also Koch, but it is to the brilliant deductions of Dr. Patrick Manson, foreshadowed in the Gouldstonian Lectures of 1894, that we owe the classical researches which have led Ross to thoroughly establish the true relations between man and the malaria-bearing mosquito. In 1895 Major Ronald Ross, of the Indian Medical Service, commenced his investigations on the lines laid down by Manson and in 1897 he succeeded in cultivating the parasite of malaria in two species of mosquito. In August of last year the development of the parasites of birds in the mosquito had been worked out and healthy birds had been infected by bites of malarial mosquitoes. The experiments of Ross have been confirmed by Dr. Daniels, of the Malaria Commission sent to Calcutta by the Royal Society and Colonial Office,* Professors Grassi, Bignani, and Bastianella of Rome, Koch of Berlin, and accepted by Manson and Ray Lankester in England, Laveran and Metchnikoff in Paris.

The writer had the pleasure of listening to the inaugural lecture by Major Ross "On the Possibility of Extirpating Malaria from certain Localities by a New Method," delivered in University College, Liverpool, soon after the opening of the School of Tropical Diseases there. The newly-appointed Lecturer in Tropical Medicine showed how the species of mosquito, by which malaria is spread, might be exterminated at a nominal cost.

The commonest kind of mosquito which swarms in Indian towns belongs to the genus *Culex*. These mosquitoes have plain unspotted wings, and usually are found sitting on walls, their bodies hanging down. They have bodies either striped or unstriped, and prefer to lay their eggs in artificial collections of water, as cisterns, water-pots, &c. around houses, and may be described as domestic mosquitoes. They bite birds as well as mankind.

The dangerous mosquitoes belong to the genus *Anopheles*, and may be called rural mosquitoes, as they do not breed in domestic water-pots, but prefer the natural ponds and puddles of the country. They have wings spotted on the anterior edge, and, when resting, the body points right out from the wall. They bite cattle as well as men, but "could not be persuaded to bite birds." Their eggs can be affixed to hard substances, and their larvæ float flat on the water like sticks, and not head downwards as do the same stage of *Culex*. Although the adult mosquitoes were common, Major Ross experienced much difficulty in finding the grubs of *Anopheles*, owing to the scarcity of their breeding-pools. This he ascribed to the fact that the puddles (*a*) must be large enough to be permanent for a few days to allow the larvæ to mature; (*b*) must not be so large as to contain minnows, which devour the larvæ; and (*c*) must not be liable to be scoured out by any shower of rain.

During several years in India Major Ross failed to cultivate human malaria in several species of *Culex*. Out of five species of *Anopheles*, on the other hand, he succeeded in cultivating the disease in two.

The above-mentioned Italian investigators have cultivated human malaria in three species of mosquitoes all of the particular genus *Anopheles*. We, therefore, feel sure that five species can carry the disease, and all belong to the genus *Anopheles*.

The genus *Culex*, and, in fact, all mosquitoes which breed in domestic vessels in proximity to dwellings, may thus apparently be exonerated from carrying malaria, whereas *Anopheles*, which is essentially a genus breeding in pools in rural districts, is found in localities where the disease abounds. *Anopheles* also is common with rainfall, as is malaria. Again, malaria is never uniformly distributed: isolated spots, even single dwellings, are known to be more malarious than the surrounding district. Major Ross concluded his lecture as follows:—

"It will be observed that the practicability of eradicating malaria in a locality by the extermination of the dangerous mosquitoes upon it depends on a single question—do these mosquitoes breed in spots sufficiently isolated and rare to be dealt with by public measures of repression? I am afraid that it is impossible to give a final answer to this question as yet; we do not yet know all the dangerous species of mosquito, much less are we acquainted with all their habits. But I have addressed you at such length on the subject to-night because I am inclined towards giving an answer in the affirmative to the question. At any rate, in view of the mischief wrought by the disease in warm countries, I certainly think that we should make every effort to ascertain whether or not we can give an affirmative answer to it. For a concrete example, suppose we were to discover by accurate investigation that all the malaria in a large town—say, on the coast of Africa—arises from a few small puddles which can be obliterated at the expense of a pound or two, would not this discovery repay our exertions, and, further, if we could next extend our operations to other towns—to numerous towns—in the tropics, should we not be more than repaid for our exertions? At all events, the question can be decided only by experiment, and the experiment is well worth making."—*The Chemist and Druggist.*

*Daniels, *Proc. Roy. Soc.*, vol. lxiv.

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION (CALCUTTA).

Extracts from abstract of Proceedings of a meeting of the General Committee held on 5th instant. *Present*:—Messrs. H. S. Ashton (*Chairman*), H. C. Begg (*Vice-Chairman*), W. Brown, R. Magor, M. K. Quin, A. Tocher, R. R. Toynbee and T. Traill. Mr. A. J. G. Cresswell, (*Honorary Secretary*) Cachar Branch, also attended by invitation. Mr. G. Ormiston was absent from Calcutta.

The proceedings of the last meeting of the Committee, held on 31st October, having been approved in circulation, were confirmed.

Letters dated 20th and 27th October, and 2nd, 10th and 17th November, from Mr. Ernest Tye, Secretary, Indian Tea Association, London, came up for final consideration after circulation. The principal subjects dealt with in these letters were:—

(*a*) *American and Foreign Market Fund.*—In his letter of 27th October, Mr. Tye recorded the result of a meeting of the London Committee held on the 17th idem, at which the disposition of the funds raised for the new levy was discussed. It had been decided at the meeting to obtain certain information in regard to the operations of the Ceylon Association; and in the letter, dated 10th November, it was stated that the latter Association were prepared to spend £6,000 in America in the course of next year. Mr. Mackenzie, the Ceylon representative, had also expressed his willingness, subject to the sanction of his Committee, to work conjointly with the Indian Association for the year 1900. He proposed to spend £4,000 during the first five months of the year on behalf of Ceylon and suggested that India should spend £1,500 in the same period. Of this sum, £60 would be allotted to a Food Show to be held in Philadelphia. A similar amount would also be set apart by Ceylon for the same purpose. These arrangements were subject to the approval of the Committee of the Indian Association. In the meantime the joint advertisements were being continued in the American newspapers. The question of operations being started in Russia, Germany and Turkey had also been before the London Committee. Messrs. James Finlay & Co. had been approached in regard to Russia, and a reply had been received giving their views on the question. This reply had still to come before the London Committee who were desirous of making arrangements, if possible, whereby the Continental markets might be worked jointly with the Ceylon Association.

letter, dated 24th November, from the Secretary, United Planters' Association of Southern India, upon the subject of the Foreign Market Fund was also considered. With the letter was forwarded copy of a speech made by Mr. G. L. Acworth, of Travancore, at the last Annual Meeting of the Association; and also copy of a resolution passed on the same occasion. The letter was to the effect that the Indian Tea Association should be asked to approach the Supreme Government, with a request to take into consideration the advisability of passing an Act under which a tax would be levied upon the exports of tea. It was proposed that the proceeds of the tax should be handed over to the representatives of the tea industry and devoted to the exploitation of foreign markets. It was also pointed out that an Act by which these objects were effected had been in force in Ceylon since 1894.

Similar proposals had been before the General Committee on previous occasions, when they had been exhaustively considered. In 189× the whole question of the possibility of such a tax being levied had been considered by the Association both in London and in Calcutta; and judging from the result of the enquiries then made there appeared to be no likelihood of its being imposed. A reply was to be sent to the United Planters' Association stating this, and pointing out that the remarks made by Mr. Acworth in which he regretted that the Association had not previously moved in the same lines as Ceylon had evidently been made under a misapprehension.

The Chairman reported that a sum of Rs.96,000 had been received on account of the Market Fund, and he thought it might perhaps be as well if a portion of it were invested until required by the London Committee.

It was decided to arrange, if possible, for the deposit of Rs. 75,000 with a first-class Bank, and the Secretary was instructed accordingly.

(*b*) *Bonded Warehouse Charges.*—Mr. Tye detailed in his letters the various steps taken by the Special Sub-Committee of the London Tea Association in regard to this matter. They had met the Tea Clearing House Committee on the 23rd October, and that body had to place had the question of the reduction under consideration. No reply had been received from them up to the date of his last letter but in the meantime Mr. Tye had seen the Secretary to the Clearing House Committee, but had been unable to elicit any information as to their intentions in the matter.

With his letter of 2nd November Mr Tye enclosed copy of a letter of 27th October from Mr. G. W. Christison on the subject of the Warehouse charges. Mr. Christison had been selected to serve on the Sub-Committee of the London Association appointed to investigate the question, but had to resign his seat on leaving for India. In the letter he expressed the opinion that a searching investigation into the methods of handling teas at the Warehouses in London was most essential; and suggested several lines of action which he thought the Sub-Committee might follow up.

The Secretary was directed, when writing to the Committee in London, to enquire what steps were being taken in regard to Mr. Christison's suggestions. The General Committee agreed with Mr. Christison in thinking that a thorough investigation into the whole subject was most essential, and they hoped this was in progress.

(*c*) *Paris Exhibition.*—In his letter of 20th October Mr. Tye stated that Mr. Langdale, who had charge of the arrangements for the sale of the tea in the cup at the Exhibition, had been unable to obtain the permission of the French authorities to sell tea in packets. Free distribution of sample packets would, however, be permitted, and it was proposed that this should be done. The packets would probably contain one ounce of tea each. The question of accommodation for the service of coffee in the cup was also dealt with in the letter of 2nd November. It had been found impossible to arrange for a separate room for the sale of coffee, and it was had, therefore, been decided that it should be served in the same room with tea. Arrangements were accordingly being made with the United Planters' Association of Southern India to effect this.

The Chairman stated that about 100 samples of tea had been received from various members of the Association for display at the Exhibition, together with samples of tea seed, dried tea leaves, &c. Sets of photographs illustrative of the tea districts, estates, labourers, factories, machinery, etc., had already been sent to London for transmission to Paris.

(*d*) *Crop Estimates.*—In his letter of 10th November Mr. Tye asked if it were intended to issue a revised estimate of the figures issued in the General Committee's Circular No. 460-O of 12th September. He also stated that there was a feeling in London that figures from Travancore should be included in the Crop Circulars, seeing that the exports to Great Britain were likely to be increased by some three millions of pounds of tea grown in that part of India.

It was agreed to point out in regard to the first point that, according to the resolution passed at the Annual Meeting held on the 16th August 1898, no revised estimate of the crop was to be issued. Two Circulars only were to be published, the first one being based on the quantity of tea manufactured to 15th August, and an estimate of the quantity to be manufactured from that date to the end of the season; and the second giving the actual outturn. It was decided to include, if possible, statistics from Travancore in future Circulars.

Considered file of papers in regard to the question of the appointment of a scientific expert for the investigation of questions connected with the cultivation and manufacture of tea. On the 23rd November the Committee had received a telegram from the Committee of the Association, in London, stating that Dr. Aug. Voelcker, Ph. D., Consulting Chemist to the Royal Agricultural Society of England, who had been approached in the matter, had recommended the engagement of a gentleman who was an experienced Agricultural Chemist, and was willing to come to India to take up the work. The Committee replied to the effect that this gentleman might be offered an engagement on the terms indicated, with the option of its being terminated at the end of the third year.

A considerable majority of the Local Associations interested in the matter had previously expressed an opinion in favour of the appointment of an Agricultural Chemist. This view was also shared by the Committee of the Association in London and by the General Committee. The Government of Bengal and the Administration of Assam had been informed of the action being taken in London; and the various Planters' Associations interested had also been communicated with.

No further action was to be taken pending a further communication from the London Committee.

Considered file of correspondence with the United Planters' Association of Southern India, the Central Travancore Planters' Association, and the Director-General of Statistics in regard to the question of obtaining accurate information as to the area of land under tea. This information was required for the Annual Report upon the tea crop published by the Government of India. The question was referred to in the proceedings of the last meeting of the Committee, held on 31st October, and they now discussed Mr. O'Conor's letter No. 496 of 29th November which had been received in reply to their No. 671-O of 4th idem. With his letter Mr. O'Conor enclosed a proof of the Report for 1898, and asked that the figures should be verified by the Committee as had been suggested by them. He also stated that he was endeavouring to obtain the names of the 84 Assam Tea Gardens from which no information was forthcoming last year.

The statistics were carefully examined by the Committee, and it was decided to submit for verification the totals of area of land under tea cultivation in the several districts to each of the Local Associations interested. Stress was to be laid upon the urgency of the matter, and a reply was to be asked for by telegram. The special attention of the Associations in Travancore was to be drawn to the need of careful verification.

The Director-General of Statistics was also to be addressed on the subject. It was to be pointed out to Mr. O'Conor that, in the opinion of the Committee, the figures of outturn from Travancore were undoubtedly inaccurate. It was also to be stated that steps were being taken to have the various totals verified by the several District Associations; and that a special effort would be made to obtain correct returns from Southern India.

Considered file of replies to the Committee's Circular No. 643-O of 25th October, in reference to the proposed regulation of offerings for the auction sales of tea in Calcutta. In the Circular, members and sellers and brokers generally were asked to state definitely—

(1) Whether they agreed that the General Committee should now proceed to formulate a scheme for the election by sellers of a Sub-Committee; and

(2) Whether when such a Sub-Committee had been formed, they would consent to accept, and be bound by their decisions.

A large number of replies had been received to the Circular, and they were carefully examined and discussed. It was evident that some difference of opinion existed as to the extent of the support required to make any scheme a success; and as it seemed most improbable that unanimity would be arrived at in regard to this

point, the Committee decided to take no further action in the matter for the present.

Considered letter of 14th November from the Honorary Secretary, to the Central Recruiting Association, in which the General Committee were asked to submit to Government a letter (which was enclosed) in which it was stated that it had been decided to abandon the scheme to establish the Association. The General Committee were also asked if the expenses (Rs.2,100) incurred during the past four years. could be defrayed from the funds of the Indian Tea Association.

After discussion it was agreed to bring this latter request before the next ensuing Annual General Meeting of the Association. The letter to the Government of Bengal had already been submitted, and a reply dated 29th November had been received to the effect that the matter had been placed before the Government of India.

Considered file of papers in connection with thefts of tea in transit from the garden to London The matter had arisen with a letter of 13th November from the Manager of the Planters' Stores and Agency Co., Ld., from which it appeared that an oragnised system of theft was in force in regard to the teas of the Doom Dooma Tea Co., Ld. The Committee addressed the Inland Steamer Companies on the subject on the 18th November, asking if any system of inspection was in force on their steamers. From the reply, dated 23rd idem, it appeared that a system of surprise checks by special Inspectors on Despatch steamers at Goalundo had been recently started. The efficiency of the check was, however, impaired by the absence of particulars of the gross weights of the teas. The Steamer Companies suggested that the gross weight, as well as the nett, should be stencilled on each package. If this were agreed to, they were prepared to place a special Inspector at Goalundo next season to make check weighments.

In the course of the discussion on the matter it was stated that some objection had formerly been taken in London to the marking of packages with the gross weight. It was accordingly agreed to ask the Committee of the Association in London whether this objection really existed at present and if it was of any importance. In the meantime a copy of the letter from the Inland Steamer Companies was to be sent to the Planters' Stores and Agency Co., Ld., for their views upon the suggestions made in it. They were also to be informed of the further action taken by the Committee.

THE BIG PRIZE TURKEY.

"A Merry Christmas, Bob," said Scrooge, with an earnestness that could not be mistaken, as he clapped him on the back. "A merrier Christmas, my good fellow, than I have given you for many a year. I'll raise your salary, and we will discuss your affairs this afternoon over a bowl of smoking bishop. Make up the fires and buy another coal scuttle, Bob Cratchit."

And as to the big prize turkey which the regenerated Scrooge sent to Camden Town, do we not all know what sort of bird it was? That turkey never could have stood upon its legs, Mr. Dickens says. They must have snapped short off like sticks of sealing wax. How they managed to cook and eat that phenomenon the author dosen't say, as it was twice the size of Tiny Tim. Yet they did it somehow, and it was a mercy if the family (previously half starved) didn't all fall ill of the unwonted gorging of that wonderful Christmas day.

Even assuming (as we easily may) that the transmutation of an old skinflint like Scrooge into a high priest of charity was quite beyond the common run of modern miracles, and that dinners from such sources are as rare as they are welcome, it still remains true that human nature is apt to be at its best at Christmas, especially in England, where, of all countries in Christendom, most is made of that gentle and kindly holiday.

Yet, sad to tell, the very jollity and generosity of Christmas leads to regretable excesses. People eat and drink too much, and suffer accordingly. The roast and the boiled, the mince pies, the plum puddings, the tremendous flushings of wine, beer, and other beverages, these things overload the stomach and give the digestion more work than it can do, and punishment follows. For Nature has no favourites; she treats those who violate her laws on the 25th December exactly as though they had committed the offence on the first Monday in August.

And as to the chronic dyspeptics, of whom there are enough in this old island to cram all the parks in London, *they* catch it fearfully about Christmastime. For, in spite of all warnings, they *will* go in for heavy meals and take the chances. Often the penalty is an acute attack which may threaten life, and nearly always weeks of pain and digestive disorders, whereof there are as many kinds as the body has organs and functions.

To them Christmas may be "merry" for an hour or two; then their merriment turns into misery, as October fogs and rains succeed a hot summer.

Now the writer is far from advising a free indulgence in the gustatory and bibulous festivities of the country's most popular holiday, but there is no use protesting against the fixed resolution of the people to enjoy themselves on that occasion. The customs and traditions of centuries are behind it, and you might as well whistle in the teeth of a north-east gale.

As a prophylactic and a cure for the evils alluded to, I can only recommend the universal use of Mother Seigel's Syrup, known to all as the best stimulant and digestant in the world.

In a letter dated January 10, 1899, a gentleman of Birmingham, who loves the pleasures of the table, and has money enough to buy whatever he wants, writes thus: "It is only fair that I should thank you, as I do with all my heart, for the good done me by Mother Seigel's Syrup For years I have been vexed with indigestion, and always had a tormenting spell of it after any public banquet or uncommon intake of rich food. Still, I was seldom able to resist temptation, although I understood perfectly well what yielding to it was sure to cost me. I have sought a preventive or a cure in vain at the hands of the best physicians, all of whom assured me that there was but one way, namely, to live on a low diet, and let luxuries alone.

"But this did not suit me, and I broke through the regulations frequently, with the inevitable results. However, when I began to use Mother Seigel's Syrup I had (almost) a license to do as to pleased. After an inviting but most risky dinner last Christmas I took a double dose of 'Mother Seigel,' and scarcely suffered at all. I told my experience, and a dozen friends adopted this amazing remedy right off I am convinced that, with a little caution, and a dose of Mother Seigel's Syrup now and then, *one may bid defiance to dyspepsia* and the abominable ailments it sets up. Thanking you a thousand times. I am, yours truly, JOHN MACFARLANE."

With these facts we wish a merry (and a *healthy*) Christmas to the British people.

MARKET REPORT.

[*Per Mail Advices of 3rd December* 1899.]

COFFEE.

A firm tone continues to prevail in this article, the supplies catalogued being chiefly disposed of at fully the advance quoted last week. A good business has also been done privately. Brazil markets continue very firm, and close dearer, good average Santos being now quoted 34s 6d, cost and freight.

Daily receipts averaged 11,000 bags in Rio, and 19,000 bags in Santos.

Futures have fluctuated considerably, closing value shewing an advance of 6d to 1/3d per cwt., *viz.*:—Good average Santos in Havre, December delivery, fcs. 40.75, in Hamburg pf. 33, and No. 7 low ordinary Rio in New York $5.90.

To-day's London official quotations are:—

TEA.

...ssrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated December 1st, 1...99, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1900	839,023	626,902	30,646
1899	831,590	606,690	23,460

...0 pkgs. In... Total 69,101 packages were offered in public auction
...6 „ ... this week.
...5 „

...e Cu... ...or taring Tea to the half pound, which was ...ed to ...lar of 17th ultimo, and was to have come ...ce on ...mber (instant), has, we understand, been ...oned ... representations made to the Custom ...e Autho...

...AVA.—A ... reduction was made in the quantity ...ght forward ... *viz.*, 47,160 packages against 52,689 ...week. No further fall has taken place in the market, and ...ugh Monday's sale passed somewhat irregularly a steadier tone was noticeable in later auctions. Now that we are getting near to Christmas, buyers are not likely to wish to increase their stocks materially, and the market may in consequence prove very sensitive and easily affected by heavy supplies. The following averages are worthy of note:—"Amal. T Est. Co. Dooteriah," 1/4¼; "Beheating," 1/2¼; "Budla Beta," 1/1¼.

Week's av. of Tea sold on Garden Account 1899, 38,429 pkgs., av. 8·22d. 1898, 36,454 pkgs., av. 8·05d.

Total Tea sold on Garden Account 1st June to date 1899, 616,698 pkgs., av. 8·55d. 1898, 586,840 pkgs., av. 8·53d.

CEYLON.—The sale this week was comparatively small, only 20,206 packages being brought forward. At the lower range of prices noticed last week competition was good and buyers showed more inclination to operate, resulting in a steady market for all descriptions.

Avge. for week 7·69d., against 8·20d. in 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 1,000,623 pkgs., av. 7·97d. 1898, 1,028,366 pkgs., av. 7·75d.

Comparative Prices of Ceylon Tea in London.

		1899.	1898.	1897.	1896.
Pekoe Soug.	(Ordinary leaf; fair liquor)	6¾d.	6½d.	6½d.	6¼d.
Pekoe	(Ordinary leaf, little twist; fair liquor)	7¼d.	7¾d.	7½d.	7¾d.
Pekoe Soug.	(Rather bold leaf; indifferent liquor)	6¼d.	5¼d.	5d.	5d.
Pekoe	(Somewhat bold leaf; indifferent liquor)	6½d.	5¾d.	5¾d.	5¾d.

JAVA.—Eight estates were brought forward, the selection on the whole being a fair average representation. There was fair competition and last week's rates were about maintained. 5,859 packages are to be offered in Amsterdam on the 8th instant.

COCOA.

We have no change to report in this article which has been very quiet throughout the past week. No auctions were held yesterday.

We quote—Trinidad, middling to fine red 74s 6d to 77s, gray and mixed red 68s to 72s; Guayaquil, Caraquez 64s 0d to 68s 6d, Arriba 67s to 72s; Ceylon, middling to fine 70s to 90s. Stock 91,194 bags, against 102,200 bags last year.

PEPPER.

Pepper quiet, and rather easier for distant positions, Singapore black having been done at 6 1/32d. for February-April shipment. White Singapore has been sold at 8 1/16d. per lb. for near position. Spot values are unaltered, at 8½d. for Penang and 8⅞d. for Singapore.

GINGER.

At auction on Wednesday cut qualities of Cochin *Ginger* were dearer, good bold selling at 92s 6d. per cwt., medium and bold at 67s 6d., small and medium at 48s. 6d., and small at 37s. to 38s.; common small native cut sold at 30s per cwt., and dull unassorted at 44s. per cwt. Rough kinds brought only steady prices, dull to good cuttings, 18s. 6d. to 19s.; bright small washed, 23s.; and Calicut brown rough. 26s. to 26s. 6d. per cwt. Japan is dearer, with small sales at 24s. 6d. per cwt. Bengal steady, at 23s. 6d. to 24s. per cwt.

CINCHONA.

The cinchona auctions to be held in Amsterdam on December 7 will consist of 6,343 bales, 49 bales and 694 cases, total 7,087 packages (606,704 kilos.). Java bark containing a total of 28,715 kilos. quinine sulphate. The average percentage of quinine is 5 14 per cent. against 5·32 per cent. in November, whereas the average percentage for the ten auctions of 1898 was 5·21 per cent. The exports from Ceylon for the week ending November 7 were 13,588 lbs., and from January 1 to November 7 they were:—

	1899.	1898.	1897.	1896.
Lbs.	566,177	776,475	611,926	1,231,359

QUININE.

QUININE is quiet and lower on the week in second hands, there being sellers on Wednesday of good German brands at 1s. 1¾d. per oz. for spot, and 1s. 2d. for March delivery. Makers' prices are unaltered at 1s. 2d. for 1,000 oz. lots.

The exports from Java during September were 130 cases, all of which were shipped to Holland. From July 1 to September 30, 1899. 562 cases have been shipped, against 396 cases for the corresponding period of 1898.

EXPORTS OF INDIAN TEA FROM CALCUTTA, FOR NINE MONTHS ENDING SEPTEMBER, AS SHOWN BY FIGURES.
